The common name of animals of the Linnean genus *Aranea*, now divided not only into many genera, but into many families, constituting a section (Araneida) of the class Arachnida, order Pulmonaria. The head and chest are united to form a segment known as a cephalothorax; no wings are developed, and breathing is effected by means of pulmonary or lung sacs. Spiders are remarkable for spinning webs for taking their prey and forming a convenient habitation. The abdomen of the spiders is unjointed, and is furnished with from four to six cylindrical or conical mammillæ or processes, with fleshy extremities, which are perforated with numberless small orifices for the passage of silky filaments of extreme tenuity, with which they form their webs, and which proceed from internal reservoirs. The legs number four pairs, and no antennæ are developed. Their mandibles are terminated by a movable hook, flexed inferiorly, underneath which, and near its extremity, which is always pointed, is a little opening that allows a passage to a venomous fluid contained in a gland of the preceding joint. After wounding their prey with their hooked mandibles, they inject this poison into the wound, which suddenly destroys the victim. A very great diversity exists in the modes in which spiders construct their webs, and in the situations in which they are placed. Some spiders do not catch their prey by entangling them in their webs, but roam abroad in search of them.

A name given by naturalists to the animals of the class Spongia, sub-kingdom Protozoa. Sponges are compound Protozoa, their living parts consisting of an aggregation of protoplasmic units. The skeleton may be horny, flinty, or limy. (See *SPONGIDA*.) In common usage the term is employed to designate the fibrous framework of sponges, as sold in our shops. This framework is soft, light, and porous, easily compressible, readily imbibing fluids, and thereby distending, and as readily giving them out again upon compression. The domestic uses of sponge are familiar to all. It is indispensable to the surgeon. Burnt sponge was formerly a valued remedy for scrofulous diseases and goitre; but iodine and bromine, from which it derived all its value, are now administered in other forms. Mattresses, &c., are stuffed with sponge; and it is also employed as a filter and as a polishing material for fine surfaces. Sponges are usually prepared before they come into the market, by being beaten and soaked in dilute muriatic acid, with a view to bleach them and dissolve any adherent portions of carbonate of lime. The kinds fit for use are found in the seas of warm climates. Two species are chiefly brought from the Levant, and a coarse one from the West Indies and the coast of Florida.—2. **Spongida**, **Spongidae** (spun/'ji-da, spun/'jī-dē), *n. pl.* An order of Protozoa or lowest animals, class Rhizopoda, sometimes elevated into a distinct class. The members are composed of two elements, an internal supporting framework or skeleton, and a soft gelatinous investing substance called *mesenchyme*, or 'flesh.' The framework consists of the horny, reticulated, elastic fibres of a substance called *keratode*, which interlace in every direction, strengthened by calcareous, or, more generally, by siliceous spicules. This framework is the sponge of commerce. On examining it we find it filled with pores, having larger openings or canals at wider distances, called *oscula* or vents. The sponge-flesh investing this framework is composed of an aggregation of organless, protoplasmic, and amoebiform bodies, some ciliated and others capable of emitting pseudopodia. A constant circulation of water goes on in the living sponge, the currents being drawn in by the pores and expelled by the oscula by means of vibratile cilia lodged in cells or chambers situated beneath the superficial layer, and by this circulation the animal is nourished. Reproduction takes place both by gemmation and true ova. In the skeletons of the true calcareous and siliceous sponges the keratode is wanting. Sponges have been classified into three groups: (a) Myxospongiae, in which no skeleton of any kind exists. (b) Calcispongiae, or limy sponges, which have no horny skeleton, but are composed of limy spicules. (c) Fibrospongiae, or those in which a fibrous skeleton exists, strengthened usually by flinty spicules.

The soul is gathered within herself and recovers that *spring* which is weakened when she operates more in concert with the body. *Addison*.

4. An elastic body, made of various materials, as a strip or wire of steel coiled spirally, a steel rod or plate, strips of steel suitably joined together, a mass or strip of india-rubber, &c., which, when bent or forced from its natural state, has the power of recovering it again in virtue of its elasticity. Springs are used for various purposes—diminishing concussion, as in carriages; for motive power, acting through the tendency of a metallic coil to unwind itself, as in clocks and watches; or to communicate motion by sudden release from a state of tension, as the bow to the arrow, the spring of a gun-lock, &c.; others are employed to measure weight and other force,

as in the spring-balance, as regulators to control the movement of wheel-works, &c. 5. Any active power; that by which action or motion is produced or propagated.

6. A natural fountain of water; an issue of water from the earth, or the basin of water at the place of its issue. Springs have their origin in the water which falls upon the earth, and sinks through porous soils till it arrives at a stratum impervious to water, where it forms subterranean reservoirs at various depths. When confined in this manner it is subject to the pressure of the water which fills the channels through which it has descended, and when this pressure is sufficient to overcome the resistance of the superincumbent mass of earth the water breaks through the superficial strata, and gushes forth in a spring. In descending downwards and rising upwards through various mineral masses the water of springs becomes impregnated with gaseous, saline, earthy, or metallic admixtures, as carbonic acid gas, sulphuretted hydrogen gas, nitrogen, carbonate of lime, silica, carbonate of iron, &c. When these substances are present in considerable quantity the springs become what are known as *mineral springs*, acquiring the peculiar properties which give them their medicinal value. Warm and hot springs are common, especially in volcanic countries, where they are sometimes distinguished by violent ebullitions. (See **GEYSER**.) As a general rule springs are permanent in proportion to the depth to which the water which supplies them has descended from the surface. Some springs run for a time and then stop altogether, and after a time run again, and again stop; these are called *intermittent springs*. (See under **INTERMITTENT**.) Others do not cease to flow, but only discharge a much smaller quantity of water for a certain time, and then give out a greater quantity; these are called *variable* or *reciprocating springs*.

According to old usage, a settled mart or market; an emporium; a town where certain commodities are chiefly taken for sale. In England, formerly, the king's staple was established in certain ports or towns, and certain goods could not be exported without being first brought to these ports to be rated and charged with the duty payable to the king or public. D. sterne*, *G. stern*; cog. *L. stella* (for *sterula*, also *astrum*), *Gr. astér*, *Armor. and Corn. steren*, *Per. satarah*, *Skr. tārā* (for *stārā*), *Vedic Skt. stri*, *pl. staras*—star. Probably from root of *E. streve*, *Skr. stri*, to strew, from the heavenly bodies scattering or sprinkling light.] 1. In a popular sense, any celestial body whatever except the sun and moon; but, in astron. the term is usually restricted to one of those self-shining bodies constituted like the sun, situated at immense distances from us, and doubtless, like our sun, the centres of systems similar to our own. Stars are distinguished from planets by remaining apparently immovable with respect to one another, and hence they were called *fixed stars*, although their fixity has been disproved in numerous cases, and is no longer believed in regard to any. The principal points which form the subjects of astronomical inquiries regarding the stars are their apparent and relative magnitudes, their distribution, their number, their distances, motions, and nature. In order to distinguish the stars one from another the ancients divided the heavens into different spaces called constellations, which they supposed to be occupied by the figures of animals and other objects, as a lion, a bear, a man, a lyre, &c. (See CONSTELLATION.) The stars are divided, according to their brightness, into stars of the first, second, third, &c., magnitudes; but no magnitude, in the proper sense of the word, has yet been observed in any star. All the stars beyond the sixth or seventh magnitude are called *telescopic stars*, as they cannot be seen without the aid of the telescope. The gradations of magnitude among the telescopic stars are continued by astronomers from the eighth down to the sixteenth. The stars are very irregularly distributed over the celestial sphere. In some regions scarcely a star is to be seen, while in others they seem crowded together, especially in the Milky Way, where they appear, when viewed through a powerful telescope, to be crowded almost beyond imagination. Of the stars visible to the naked eye at any one time the number probably does not exceed a few thousands, but in the telescope their number is so great as to defy all calculation; and, besides, there is every reason to believe that there are countless hosts which lie beyond the reach of the most powerful telescopes. The distances of the fixed stars from the earth are very great. The nearest yet found, that of α Centauri, a double star in the southern hemisphere, being calculated at 20 billions of miles, so that light takes 3½ years to travel from it to our earth. Many stars have been observed whose light appears to undergo a regular periodic increase and diminution of brightness, amounting, in some instances, to a complete extinction and revival. These are called *variable* and *periodic stars*. It is found that some stars, formerly distinguished by their splendour, have entirely disappeared, others have shone forth with extraordinary brilliancy, and, after a longer or shorter period, have gradually died away and become extinct. These are called *temporary stars*. Many of the stars are found, when observed with telescopes of high magnifying power, to be composed of two, and some of them of three or more stars in close juxtaposition. These are termed *double* and *multiple stars*. The appearances known as nebulae are, in many cases at least, agglomerations of stars, separated from our system and from one another by unfathomable starless intervals. See NEBULA.—Binary stars, sidereal systems composed of two stars revolving about each other in regular orbits.—Falling or shooting stars. See FALLING-STAR.—Pole-star, a bright star in the tail of

See **STARK**.] ( $C_6H_{10}O_5$  or  $C_{12}H_{20}O_{10}$ .) A proximate principle of plants, universally diffused in the vegetable kingdom, and of very great importance. It occurs in seeds, as in those of wheat and other cereal grains, and also in leguminous plants; in roots, as in the tubers of the potato; in the stem and pith of many plants, as in the sago plant; in some barks, as in that of cinnamon; and in pulpy fruits, such as the apple. Finally, it is contained in the expressed juice of most vegetables, such as the carrot, in a state of suspension, being

deposited on standing. The starch of commerce is chiefly extracted from wheat flour. When pure, it is a snow-white powder of

a glistening appearance, which makes a crackling noise when pressed with the finger. It is composed of transparent rounded grains, the size of which varies in different plants, those of the potato being among the largest, and those of wheat and rice the smallest. It is insoluble in cold water, alcohol, and ether; but when heated with water it is converted into a kind of solution, which, on cooling, forms a stiff semi-opaque jelly. If dried up, this yields a translucent mass, which softens and swells into a jelly with water. It is employed for stiffening linen and other cloth. When roasted at a moderate heat in an oven it is converted into a species of gum employed by calico-printers; potato starch answers best for this purpose. (See **DEXTRINE**.) Starch is convertible into sugar by dilute sulphuric acid. Starch forms the greatest portion of all farinaceous substances, particularly of wheat flour, and it is the chief ingredient of bread. The woodcut shows the cells of the common potato (*Solanum tuberosum*) filled with starch granules, *a. a.*—2. A stiff formal manner; starchedness; as, to take the *starch* out of a person.

It consisted originally of a committee of the privy-council, and was remodelled during the reign of Henry VIII., when it consisted of four high officers of state, with power to add to their number a bishop and temporal lord of the council, and two justices of the courts of Westminster. It had jurisdiction of forgery, perjury, riots, maintenance, fraud, libel, and conspiracy, and in general of every misdemeanour, especially those of public importance; it was exempt from the intervention of a jury, and could inflict any punishment short of death. Under Charles I. the scope of the Star-chamber was extended to cases properly belonging to the courts of common law, solely for the purpose of levying fines. Its process was summary, and often iniquitous, and the punishment it inflicted often arbitrary and cruel. This court was abolished by statute 16 Charles I.

Perhaps from a root *stain*, signifying dark, seen without the *s* in Skr. *tamas*, darkness, *timira*, dark.] 1. The vaporous substance into which water is converted under certain circumstances of heat and pressure; water in a gaseous state. Water gives off vapour or steam at every temperature—a low temperature not preventing the formation of steam, but only decreasing its density. The term, however, is strictly applied to the elastic aeriform fluid generated by heating water to the boiling-point. When water in an open vessel is heated to the temperature of 212° F., or to the boiling-point, globules of steam are formed at the bottom, and rise to the surface; and the continued application of heat, even though increased indefinitely, will only cause a more copious and rapid formation of steam, and will finally evaporate the whole of the water without raising the temperature of either. In this case all the heat which enters into the water is solely employed in converting it into steam of the temperature of boiling water. But if the water be confined in a strong close vessel, both it and the steam which it produces may be brought to any

ted, by means of a rod attached to the piston, to a strong beam *ff*, movable upon a central axis, a system of jointed rods *ee*, called the *parallel motion*, being interposed for the purpose of neutralizing the disturbing action which the circular path of the beam would otherwise exert upon the piston. The reciprocating motion of the beam is now, through the intervention of the connecting-rod *g* and crank *h*, converted into a circular or rotatory motion, which is rendered continuous and uniform by the fly-wheel *i*, to the axis of which the machinery to be impelled is connected. The air-pump *p* for withdrawing the vapour and water from the condenser, the feed-pump *s* for supplying the boilers, and cold-water pump *t* for supplying the condenser cistern, are all worked by rods from the beam; and the governor *u*, for maintaining uniformity of motion, is driven by a band from the crank-shaft. The above description refers more immediately to that class of steam-engines called *low-pressure* or *condensing* engines, in which the power derived from the rapid condensation of the steam is made available in combination with that due to its elasticity; but if we suppose the condensing apparatus removed, and the waste steam allowed to escape into the atmosphere, it will then be equally applicable to that kind called *high-pressure* or *non-condensing* engines, which employ the elastic action of the steam alone. Steam-engines are classified in various ways, as *portable*, *marine*, *locomotive*, *pumping*, *blowing*, *winding*, &c. According to the arrangement of the chief parts they are classed as *beam*, *oscillating-cylinder*, *horizontal*, *vertical*, &c. The mechanical energy of a steam-engine is usually estimated in horse-power. See HORSE-POWER.

**Steam-gauge** (stêm'gâi), *n.* An attachment to a boiler to indicate the pressure of steam; a pressure-gauge. There are many forms. One of the older is a bent tube partially filled with mercury, one end of which springs from the boiler, so that the steam raises the mercury according to the amount of pressure. A very common form of gauge is that known as *Bourdon's*, which consists essentially of a flattened metal tube, closed at one end and bent circularly, into which the steam is admitted. As such a tube tends to straighten itself out by the force of the steam the amount of pressure can easily be ascertained by an attached index apparatus.

**Steam-governor** (stêm'gu-vérn-ér), See GOVERNOR.

**Steam-gun** (stêm'gun), *n.* A gun the projectile force of which is derived from the expansion of steam issuing through a shotted tube.

**Steam-hammer** (stêm'ham-ér), *n.* A form of heavy forge hammer operated by steam, consisting usually of a steam cylinder and piston, with metal striker attached, placed vertically over the anvil. There are two principal varieties: In one the cylinder is fixed, and the hammer is attached to the piston-rod, and is operated by the direct action of the steam in the cylinder; in the other the piston is fixed, and the hammer is attached to the lower end of the cylinder, which similarly rises and falls by the action of the steam in the cylinder. The former is known as *Nasmyth's*, and the latter as *Condie's* hammer, which is shown in the cut attached. In the entablature of the figure is a steam and exhaust valve, and attached to it a hollow piston-rod, acting as steam and exhaust pipe, to which the piston is attached as a fixture. The steam, being introduced into the cylinder or hammer immediately above the piston, presses the cylinder cover,

and raises the hammer between the guides to the required height. The steam being then cut off, and the exhaust-valve opened,

Steam-hammer.

the hammer falls, not only with the velocity of gravity, but with the additional velocity produced by the compression of the air under the piston during the latter portion of the hammer's ascent, which, acting as a recoil, adds considerably to the effect of the blow. With the most powerful hammers steam is also introduced on the under side of the piston, so as to augment still further the speed and force of the blow. The valves and valve-gearing are so arranged that the person in charge of the machine can arrest the motion of the hammer while falling, or cause it to fall at any moment while ascending. In *Ramsbottom's* hammer two hammer cylinders move horizontally in the same line, but in opposite directions, and the piece to be forged is placed between the two. There are some other kinds of steam-hammers suitable for light work, in most of which the hammer-head is attached to the end of a horizontal shaft which acts as a lever, the fulcrum of which is nearer the free end of the shaft than the end bearing the hammer. The hammer is raised by cams attached to a revolving drum, and falls when by the revolution of the drum the shaft is freed from one of the cams. These are often called *Steam-tits*.

The annexed figure represents a section of a locomotive steam-whistle: *a* is a tube fixed to the top of the boiler, and opening into its interior; it is commanded by a stop-cock *e*; the tube is surmounted by a hollow piece *b*, perforated with holes, and surrounded by a thin brass cup *c*; the respective diameters of the piece *b* and cup *c* being so adjusted as to leave a very narrow orifice all round. Another thin brass cup *d* is fixed in an inverted position at a short distance above the upper surface of the parts *b* and *c*, so as to present a sharp edge exactly opposite the orifice above mentioned. On opening the stop-cock *e* the steam, rushing with

great violence through the circular orifice, encounters the edge of the cup *c*, and thereby produces a loud and shrill sound which may be heard at the distance of several miles. Steam-whistles are made to give musical tones varying in pitch by graduating the length of the pipe or cup, and a series of whistles tuned to different notes and operated by keys forms the musical instrument called the calliope.

**Steam-winch** (stêm'winsh), *n.* A form of winch or hoisting apparatus in which rotatory motion is imparted to the winding axle from the piston-rod of a steam-engine, directly, or indirectly by means of bevel-gearing, the direct action giving most rapidity, the indirect most power.

**Stearic** (sté-ar'ik), *a.* Of, pertaining to, or obtained from stearine. — *Stearic acid* ( $C_{18}H_{36}O_2$ ), a monobasic acid, perhaps the most important and most abundant of the fatty acids. It exists in combination with glycerine, as stearine, in beef and mutton fat, and in several vegetable fats, such as the butter of cacao. It is obtained from stearine by saponification, and also from mutton suet by a similar process. Stearic acid is in the form of brilliant white scaly crystals; it is inodorous, tasteless, insoluble in water, but soluble in alcohol and ether. It burns like wax, and is used in the formation of candles. It forms compounds with the alkalies, earths, and metallic oxides, which are called stearates.

**Stearine, Stearin** (sté'a-rin), *n.* [*Gr. stear, suet.*] ( $C_{57}H_{110}O_6$ ) 1. The chief ingredient of suet and tallow, or the harder ingredient of animal fats, oleine being the softer one. It is obtained from mutton suet by repeated solution in ether and crystallization. It may also be obtained by pressing tallow between hot plates, and afterwards dissolving in hot ether, which on cooling deposits the stearine. It has a pearly lustre, is soft to the touch, but not greasy. It is insoluble in water, but soluble in hot alcohol and ether. When treated with superheated steam it is separated into stearic acid and glycerine, and when boiled with alkalies is saponified, that is, the stearic acid combines with the alkali, forming soap, and glycerine is separated. When melted it resembles

**wax.** There are three stearines, which may be all regarded as derivatives of glycerine in which one, two, or three OH groups are replaced by the radical stearyl. Natural stearine is the tristearyl derivative of glycerine.—2. A popular name for stearic acid as used in making candles.

Iron combined with a small portion of carbon. Steel usually contains also small quantities of silicon, phosphorus, manganese, and sulphur, but iron and carbon appear to be its only essential constituents. The relative proportions of iron and carbon vary in steel of different qualities; but in that used for ordinary purposes the carbon amounts from about 0.5 to 1.5 per cent, the toughness, tenacity, and hardness increasing with the increase of the carbon, the elasticity diminishing as the hardness increases, and *vice versa*. At a red heat steel is malleable and may be welded. The colour is a bright grayish white, the texture closely granular, the specific gravity varying from 7.62 to 7.81. Steel formed from bar-iron by cementation is called *blistered steel*, from its surface ac-

quiring a *blistered* character in the process. (See CEMENTATION.) When blistered steel is rolled or beaten down into bars, it is called *shear-steel*, and if it be melted, cast into ingots, and again rolled out into bars, it forms *cast-steel*. Cast-steel is now largely manufactured by what is known as Bessemer's process. (See BESSEMER'S PROCESS.) *Natural or German steel* is an impure and variable kind of steel procured from cast-iron, or obtained at once from the ore. The natural steel yielded by cast-iron, manufactured in the refining houses, is known by the general name of *furnace steel*, and that which has only been once treated with a refining furnace is particularly called *rough steel*. The peculiarity of steel, upon which its high value in the arts in a great measure depends, is its property of becoming hard after being heated to redness and then suddenly cooled by being plunged into cold water, and of being again softened down to any requisite degree by the application of a certain temperature. This process is called *tempering*. It is found that the higher the temperature to which steel is raised, and the more sudden the cooling, the greater is the hardness; and hence, any degree of hardness can be given to steel which is required for the various purposes to which it is applied. According to the degree of hardness to which steel is tempered it assumes various colours, and formerly these colours served as guides to the workman. Now, however, a thermometer, with a bath of mercury or oil, is employed, and the operation of tempering is performed with a much greater degree of certainty. The uses of steel in forming various kinds of instruments, edge-tools, springs, &c., are well known.—*Indian steel*. See WOOLZ.—2. *Fig.* a weapon; particularly, an offensive weapon, as a sword, spear, and the like.

**-ster**. A termination as in *waitster*, *gamester*, *spinster*, *songster*, denoting occupation. In the earliest times, and up to about the end of the thirteenth century, it was generally the sign of the feminine gender, corresponding to the masculine *-ere* or *-er*. In the fourteenth century it began to give place as a feminine termination to the Norman *-ess*. In modern literary English there is now only one feminine word with this suffix, viz. *spinster*, but *huicster* was used very late as a feminine; and in Scotch and provincial English *seester* is still used. When the suffix *-ster* was felt no longer to mark the feminine distinctively, some new feminines were formed by the addition of the termination *-ess* to the *-ster*, as *songstress* and *seamstress*.

The suffix *-ster* now often marks the agent with more or less a sense of contempt and depreciation, as *funster*, *trickster*, *gamester*. *Dr. Morris.*

But we cannot recognize the termination *-ster* as being, or as having been at some time past, a feminine formative in every instance. Not only does the present use of such old words as *huicster*, *huicster*, *waitster*, *songster*, *ifester*, not to urge the more recent *oldster*, *youngster*, *roadster*, make it hard to prove them all feminine; but even if we push our inquiries further back we nowhere find the group clearly defined as such except in modern Dutch. There was in Anglo-Saxon *hæcere* and *hæcistre*, and yet Pharaoh's baker in Genesis xl. is *hæcistre*. Grimm conjectured that these nouns in *-estre* are all that is left of an older pair of declensions, whereof one was masculine in *-estre*, the other feminine in *-estre*. *J. Earle.*

**Stereoscope** (stér-ē-ō-skōp), *n.* [Gr. *stereos*, solid, and *skopô*, to view.] An optical instrument to illustrate the phenomena of binocular vision. An object viewed by both eyes does not appear to each under the same angle; hence whatever we look upon is apprehended by the sense of vision through the medium of two distinct images which unite in the sensorium of the brain and give us the idea of substance and solidity. The stereoscope is an optical apparatus which enables us to look upon two pictures taken under a small difference of angular view, each eye looking upon one picture only; and thus, as in ordinary vision, two images are conveyed to the brain which unite into one, exhibiting the objects represented under a high degree of relief. A reflecting form of stereoscope was invented

Stereoscope.

by Sir C. Wheatstone in 1838. It is so constructed that the two pictures are reflected to the eyes from two small plane mirrors placed at right angles the faces being towards the observer. Subsequently Sir D. Brewster invented the lenticular or refracting stereoscope, based on the refractive properties of

semi-double convex lenses. This is the one now in general use. There are many forms of it, one of which is shown in the figure. *a a* are tubes containing the two halves of a lens; *b b* is a glass slide on which the two views are depicted by the photographic process; *c* is a flap, covered with a light-coloured paper to receive the light and reflect it upon the slide, the lid on the top admitting light when the pictures are opaque. When the tubes *a a* are adjusted to suit the eye the observer takes the one picture into the right eye and the other into the left eye, but the perceptive faculty apprehends only one image, and that in bold substantial relief and intensity.

**Stereotrope** (stér-ē-ō-trōp), *n.* [Gr. *stereos*, solid, and *trōpê*, a turning, from *trépô*, to turn.] An instrument by which an object is perceived as if in motion and with an appearance of solidity or relief as in nature. It consists of a series of stereoscopic pictures, generally eight, of an object in the successive positions it assumes in completing any motion, affixed to an octagonal drum revolving under an ordinary lenticular stereoscope, and viewed through a solid cylinder pierced in its entire length by two apertures, which makes four revolutions for one of the picture-drum. The observer thus sees the object constantly in one place, but its parts apparently in motion and in solid and natural relief.

**Stereotype** (stér-ē-ō-tip), *n.* [Gr. *stereos*, fixed, and *typos*, type, form.] 1. *Lit.* fixed metal type; hence, a plate cast from a stucco or papier-mâché mould, on which is a facsimile of the superlatives of arranged types, which plate being fitted to a block may be used under the press exactly as movable types are used, and being retained may serve at any time to throw off an additional impression. The plates are composed of an alloy similar to ordinary type-metal. The original process, invented by Mr. William Ged, a goldsmith of Edinburgh, consisted in taking a stucco cast of a form of type, which, after being subjected to a gradual baking, was used as a mould to obtain the facsimile of the form of type. This process has been greatly supplanted by what is known as the papier-mâché process. This generally consists in covering the form, the face of which is oiled, with a soft, moist matrix of several sheets of tissue, blotting, and brown paper, stuck together by a mixture of glue, paste, and powdered French chalk, the tissue paper being next the type. A wet linen cloth is laid over the paper, and the matrix is dabbed by a beating-brush so as to drive the soft paper into all the interstices between the letters of the form. The hollows which now appear in the back are filled up by a smooth coat of stucco; and the matrix, after being backed up by a sheet of strong paper, is next subjected to a heavy pressure over a steam-press and thoroughly dried while still connected with the type. It is then removed and placed in a casting-box, into which molten metal is poured, so as to produce from the matrix a plate with the type in relief. When the metal is set the mould is opened, the matrix removed, and the plate trimmed and prepared for use. For rotary printing-machines both matrix and plate form the segment of a circle to enable the plate to fit on to the impression cylinder. For printing the finer class of illustrated books, &c., plates are produced by the process of electrotyping. See ELECTROTYPING. — *Stereotype block*, a block of wood on which a stereotype is mounted to make it type high. 2. **Stoic** (stó'ik), *n.* [Gr. *Stoikos*, from *Stoa*, a porch in Athens where the philosopher Zeno taught.] 1. A disciple of the philosopher Zeno, who founded a sect about 308 B.C. He taught that men should be free from passion, unmoved by joy or grief, and submit without complaint to the unavoidable necessity by which all things are governed. The Stoics are proverbially known for the sternness and austerity of their ethical doctrines, and for the influence which their tenets exercised over some of the noblest spirits of antiquity, especially among the Romans. Their system appears to have been an attempt to reconcile a theological pantheism and a materialist psychology with a logic which seeks the foundations of knowledge in the representations or perceptions of the senses, and a morality which claims as its first principle the absolute freedom of the human will. The Stoics teach that whatever is real is material; matter and force are the two ultimate principles; matter is of itself motionless and unformed, though capable of receiving all motions and all forms. Force is the active, moving, and moulding principle, and inseparably joined with matter; the working force in the universe is God, whose existence as a wise thinking being is proved by the beauty and adaptation of the world. The supreme end of life, or the highest good, is virtue, that is, a life conformed to nature, the agreement of human conduct with the all-controlling law of nature, or of the human with the divine will; not contemplation, but action, is the supreme problem for man; virtue is sufficient for happiness, but happiness or pleasure should never be made the end of human endeavour. The wise man alone attains to the complete performance of his duty; he is without passion, although not without feeling; he is not indulgent, but just toward himself and others; he alone is free; he is king and lord, and is inferior in inner worth to no other rational being, not even to Zeus himself. **Stomach** (stum'ak), *n.* [L. *stomachus*, the gullet, oesophagus, stomach, from Gr. *stomachos*, the throat, the gullet, from *stoma*, a mouth.] 1. A membranous receptacle, the principal organ of digestion, in which food is prepared for nourishing the body. The human stomach is of an irregularly conical or pear-shaped form; it is situated in the epigastric region, lying almost transversely across the upper and left portion of the abdominal cavity. Its largest extremity is directed to the left, its smaller to the right. Its superior orifice, where the oesophagus terminates, is called the *cardia*; the inferior orifice, where the intestine begins, the *pylorus*. The stomach is composed of three coats or membranes, connected by a firm but very extensible cellular tissue. The external or peritoneal coat is a dense firm membrane; the internal or mucous coat is soft and vascular; the central coat is muscular. The glands of the stomach are situated in the mucous coat. The arteries of the stomach come chiefly from the celiac artery, and are accompanied by veins which terminate in the *vena portae*, or veins conveying venous blood to the liver for the purpose of secreting bile. The nerves of the stomach are very numerous, and come from the eighth pair and the sympathetic nerve. The lymphatic vessels are distri-

buted throughout the whole substance, and proceed immediately to the thoracic duct. The stomach owes its digestive powers chiefly to the gastric juice, an acid liquid which is secreted by innumerable follicles in the mucous coat, and the action of which upon various elements of food is somewhat similar to that of prolonged boiling in water. Digestion is also aided by the performance of certain well-defined stomachic movements, which are well calculated to mix and thoroughly combine the food particles with its contained fluids. In mammals there are three kinds of stomachs, *simple*, *complex*, and *compound*. In the *simple* it consists of a single cavity, as in man and the Carnivora, &c. This is the most common form. The *complex* has two or more compartments communicating with each other, with no marked difference of structure, as in the kangaroo, squirrel, porcupine, &c. The Cetacea have from five to seven such compartments. The *compound* stomach is peculiar to the ruminants. It consists of four compartments, differing materially in size and in the structure of the lining mucous membrane. The first and largest cavity is the *paunch* or *rumen*, into which the food is first received; the second, the *honeycomb* or *reticulum*, so named from its lining membrane forming deep polygonal cells; the third, the *spalterium* or *omasum*, called 'maniples' or 'moniples' (Scottish), from its foliated structure. All these three compartments are merely useful in the preparing the food for the fourth or true stomach, called also *reed* or *abomasum*, where the gastric juice is secreted and food finally digested. See RUMINANTIA.—2. Any specialized cavity for the digestion of food, such as the digestive cavity in Hydrozoa, &c.—3. As appetite or *stomach* to meat is a sign of health in the body, so is this hunger in the soul a vital quality. *Hammond*.

It resembles the common syringe, except that it has two apertures near the end, instead of one, in which the valves open different ways, so as to constitute a sucking and a forcing passage. When the object is to extract from the stomach, the pump is worked while its sucking orifice is in connection with a flexible tube passed into the stomach; and the extracted matter escapes by the forcing orifice. When it is desired, on the contrary, to throw cleansing water or other liquid into the stomach, the tube is connected with the forcing orifice, by which the action of the pump is reversed.

In *geol.* a layer of any deposited substance, as sand, clay, limestone, &c., which is spread out over a certain surface by the action of water, or in some cases by wind, especially such a layer when forming one of a number superposed. The deposition of successive layers of sand and gravel in the bed of a river, or in a canal, affords an illustration both of the form and origin of strata. Geologists generally make a distinction between a *stratum* and a *bed*, restricting the latter term to the thicker kind of strata; others, however, use the terms synonymously. Strata may be said to vary in thickness from a few inches to several feet. A single stratum again is often seen to be made up of thinner layers, called *laminae*. Strata are separated from each other by seams or parallel planes, and sometimes by joints or fissures, forming some angle with the planes. When strata do not lie horizontally but are inclined, they are said to *dip* towards some point of the compass, and the angle they make with the horizon is called the *angle of dip* or *inclination*. The direction or *strike* of the strata is indicated by a horizontal line at right angles to the dip. When strata protrude above the surface, or appear uncovered, they are said to *crop out*. They are said to be *conformable* when their planes are parallel, whatever their dip may be; and *unconformable* when a set of them are connected with another, so that the planes of stratification of the one series have a different direction from that of the other series. On examining the crust of the earth we find that it consists chiefly of distinct strata of different materials. These differ in depth and extent, but they are found to follow each other on the large scale, as masses in an apparently regular and uniform succession, in all places, districts, and countries, where they admit of examination, and have been attentively studied. They appear in most instances to rest upon, and are blended with, invaded, and, in some few instances, overflowed, as it were, by unstratified rocks. See GEOLOGY.—2. **Strongest**, *a. superl.* Strongest. *Chaucer*.

**Strength** (strenght), *n.* [A. Sax. *strengthu*, strength, from *strang*, strong; comp. *length* and *long*. See **STRONG**.] 1. That property, attribute, or quality of an animal body by which it is enabled to move itself or other bodies. The strength of animals is the muscular force or energy which they are capable of exerting; as, not to have *strength* enough to lift the arm or to walk. In order to compare the effects produced by different animals, or the same animal under different circumstances, it is usual to estimate the force required to raise or transport 1 lb. through 1 foot of space in 1 minute of time, which force is called the *dynamic unit*. Hence, if an animal, as a horse, for example, is capable of raising 33,000 lbs. 1 foot high in a minute, he must exert a force 33,000 times greater than that required to raise 1 lb. through the same space in the same time. Of the different modes of estimating human strength the most practically useful is the observation of the average effect produced daily by a labourer who continues his exertions for a number of successive days, as in transporting materials in a wheelbarrow, carrying or dragging a load, working a pump, turning a winch, rowing a boat, &c.—2. The quality of bodies by which they sustain the application of force without breaking or yielding; solidity or toughness; as, the *strength* of a bone; the *strength* of a beam; the *strength* of a wall; the *strength* of a rope. The conditions which determine the strength of solid bodies, and their power to resist forces tending to produce fracture, are found by experiment. A force acting on solid bodies may tend to separate its parts in different ways. Thus a body may be torn asunder by a stretching or tensile force or direct pull applied in the direction of its fibres, as in the case of ropes, &c.; or it may be broken across by a transverse strain, crushed by a pressure exerted in the direction of its length, twisted, shorn across, &c.—3. Power or vigour of any kind; ability to do or bear; capacity for exertion, whether physical, intellectual, or moral; as, *strength* of mind, memory, or judgment; *strength* of evidence, argument, or persuasion; *strength* of feeling, affection, and the like.

This act  
Shall bruise the head of Satan, crush his strength. *Milton*.

Aristotle's large views, acuteness and penetration of thought, and *strength* of judgment, few have equalled. *Locke*.

4. Power of resisting attacks; as, the *strength* of a castle or fort.

Our castle's strength  
Will laugh a siege to scorn. *Shak.*

5. One who or that which is regarded as embodying force, strength, or firmness; that on which confidence or reliance is placed; support; security. 'My only *strength* and stay.' *Milton*.

God is our refuge and strength. *Ps. xlii. 1.*

6. Force or power in expressing meaning by words; vigour of style; nervous diction; as, a writer of great *strength*. The *strength* consists in the full and forcible exhibition of ideas, by which a sensible or deep impression is made on the mind of a hearer or reader.

And praise the easy vigour of a line,  
Where Denham's strength and Waller's sweetness join. *Pope*.

7. Vividness; intensity; brightness; clearness; brilliance; as, *strength* of colour or light.

It was discovered by Dr. Hope in 1792. It has subsequently been found in England, America, and France; but strontitic minerals are rather rare. The pure earth to which the name of strontia is given is prepared from the carbonate exactly like baryta. It is a grayish-white powder, infusible in the furnace; of a specific gravity approaching that of baryta, having an acrid burning taste, but not so corrosive as baryta, though sharper than lime, and an alkaline reaction. It becomes hot when moistened, and slakes into a pulverulent hydrate (Sr(OH)<sub>2</sub>), dissolves in 150 parts of water at 60°, and in much less at the boiling-point, forming an alkaline solution called *strontia water*, which deposits crystals in four-sided tables as it cools. These crystals have the composition Sr(HO)<sub>2</sub>.8H<sub>2</sub>O. It is readily distinguished from baryta by forming with hydrochloric acid a chloride which crystallizes in needles, and is very deliquescent, and soluble in alcohol, to which it gives the property of burning with a crimson flame. The sulphate of strontia is found native, and some of the native varieties have a pale blue tint, whence the term *celestine* (which see). The nitrate of strontia is used in making fireworks, as it communicates a magnificent red colour to flame.

**Strontium** (stron'shi-um), *n.* [From *Strontian*, in Argyleshire, where its carbonate occurs.] Sym. Sr.; at. wt. 175. The metal of which strontia is the oxide, procured from the carbonate of strontia by Davy in 1808. It is a dark yellow substance, less lustrous than barium; sp. gr. 2.54: it is difficultly fusible, and not volatile. When exposed to the air it attracts oxygen, and becomes converted into strontia, or protoxide of strontium; when thrown into water it decomposes it with great violence, producing hydrogen gas, and forming with the water a solution of strontia. Strontium is harmless, while barium and all its compounds are poisonous.

Sturgeon (*Acipenser sturio*).

A ganoid fish of the genus *Acipenser*, family Sturionidae, the members of which family are popularly included under the name sturgeon. The general form of the sturgeon is similar to that of the shark, but the body is covered with numerous bony plates in longitudinal rows; the exterior portion of the head is also well mailed; the mouth placed under the snout is small and edentate; the palatal bones, soldered to the maxillaries, convert them into the upper jaw. The mouth, placed on a pedicel that has three articulations, is more protractile than that of a shark. The eyes and nostrils are on the side of the head, and cirri are inserted under the snout. On the back is a single dorsal fin, and the tail is forked. The sturgeons ascend the larger rivers of Europe in great abundance, and are the objects of important fisheries. The flesh of most of the species is wholesome and agreeable food; their ova is converted into caviare, and their air-bladder affords the finest isinglass. The common sturgeon (*Acipenser sturio*) is found in most of the large rivers of Europe. Its flesh is delicate and well-flavoured, somewhat resembling veal. When caught in the Thames, within the jurisdiction of the Lord-mayor of London, it is a royal fish, reserved for the sovereign. The sterlet (*A. ruthenus*) is found in the Volga and the Danube. (See **STERLET**.) The great or white sturgeon, or beluga (*A. huso*), is found in the Danube, the Volga, and other rivers running into the Black and Caspian Seas. It frequently exceeds 12 and 15 feet in length, and weighs

above 1200 pounds. The flesh is not much esteemed, but the finest isinglass is made from its air-bladder. There are several species peculiar to North America.

Anything resembling a style in being pointed; as, (a) a pointed tool used in gravings; a graver. (b) A pointed surgical instrument; a probe. (c) The pin or gnomon of a sun-dial, which projects the shadow on the plane of the dial. (d) In bot. the prolongation of the summit

a, Style; b, Stigma.

of the ovary which supports the stigma. Some-

times it is entirely wanting, and then the stigma is sessile, as in the poppy and tulip. When the

ovary is composed of a single carpel, the style

is also single, and the number of styles varies

according to the number of carpels, though when

the carpels are numerous the styles may be united.

Considered in reference to its direction or

position, the style may be lateral, basal, ver-

tical, included, protruded, ascending, or de-

clinate. Viewed in reference to its form, it

may be filiform, subulate, trigonal, clavi-

form, or petaloid. Viewed with reference

to its divisions, it may be simple or divided;

when the divisions do not extend far, it is

slit; when more prolonged, partite. Thus

it may be bifid or bipartite, trifid or tripar-

tite, &c. After fecundation the style gener-

ally falls off, when it is said to be cadu-

cous; but when it remains, it is said to be

persistent.—3. Manner of writing with re-

gard to language; the peculiar manner in

which a person expresses his conceptions;

the particular mode or form of expressing

ideas in language which distinguishes one

writer or speaker from another; the dis-

tinctive manner of writing which belongs to

each author, and also to each body of

authors, allied as belonging to the same

school, country, or epoch.

Proper words in proper places make the true

description of a style. *Swift.*

Yet let some lord but own the happy lines,

How the wit brightens and the style refines! *Pope.*

The style which deals in long sentences or in short

sentences, or indeed which has any trick in it, is a

bad style. . . . The best thing which, to my mind,

has been ever said about style was said in a meta-

phorical way, the writer declaring that the style

should, as it were, involve and display the subject-

matter, as the drapery in a consummate statue folds

over and around the figure. *Sir A. Helps.*

4. Mode of presentation, especially in music

or any of the fine arts; characteristic or pec-

uliar mode of developing an idea or accom-

plishing a result. Style in the arts depends

on the character of the artist, the subjects,

the art itself, the materials used, the object

aimed at, &c. The style varies in different

periods, and is also influenced by differences

of national character. The various branches

of an art, too, have each its peculiar style.

Thus in poetry there are the epic, lyric, and

dramatic styles; in music, the sacred, opera,

and concert styles, the vocal and instru-

mental styles, the sonata and symphony

styles, &c.; in painting there are the histori-

cal, landscape, &c., styles.—5. External man-

ner or fashion; often, manner deemed ele-

gant and appropriate in social demeanour;

fashion; as, the entertainment was got up

in excellent style.—6. Phrase of address or

appellation; formal or official designation;

title; as, any one having the style of majesty.

'One style to a gracious benefactor, another

to a proud insulting foe.' *Burke*.—7. In

arch. a particular character as to the gen-

eral artistic idea pervading a building; as, the Gothic style, the Grecian style, the Moorish style, the Norman style, &c.—8. In chron. a mode of reckoning time with regard to the Julian and Gregorian calendar. (See GREGORIAN, JULIAN.) Style is Old or New. The Old Style follows the Julian manner of computing the months and days, in which the year consists of 365 days and 6 hours. This is something more than 11 minutes too much, and in the course of time, between Caesar and Pope Gregory XIII., this accumulated error amounted to 10 days. Gregory reformed the calendar by retrenching 10 days, and fixing the ordinary length of the civil year at 365 days; and to make up for the odd hours it was ordained that every fourth year (which we call leap-year) should consist of 366 days. But the true length of the solar year is only 365 days 5 hours 48 minutes 51.6 seconds; hence, four solar years would fall short of four years of 365 days 6 hours each, or of four Julian years, three of 365 days and one of 366 days, by 44 minutes 33.6 seconds, and 400 solar years would fall short of 400 Julian years by 74 hours 16 minutes, or by a little more than three days. This error it was ordained should be rectified by omitting three days in three of the four years which completed centuries; or, in other words, that the centuries divisible without remainder by 400, should alone of the centuries be accounted leap-years. Thus 1600, 2000, 2400 would be leap-years, but not 1700, 1800, 1900, 2100, 2200, 2300. This mode of correcting the calendar has been adopted at different times in almost all civilized nations with the exception of Russia and those countries where the Greek Church is predominant, which still adhere to the Old Style. In England the Gregorian or New Style was adopted by act of parliament in 1752, and as one of the years concluding a century in which the additional or intercalary day was to be omitted (the year 1700) had elapsed since the correction by Pope Gregory, it was necessary to omit 11 instead of 10 days in the current year. Accordingly 11 days in September, 1752, were retrenched, and the 3d day was reckoned the 14th. The difference between the Old and New Styles is now 12 days.—*Style of a court, in law*, the practice observed by any court in its way of proceeding.—*Judicial styles*, in Scots law, the particular forms of expression and arrangement necessary to be observed in formal deeds and instruments.—*Dictionary, Phraseology, Style*. One who is placed under the authority, dominion, or influence of some one else; specifically, one that owes allegiance to a sovereign and is governed by his laws; one who lives under the protection of, and owes allegiance to, a government; as, the natives of Great Britain are *subjects* of the British government; the natives of the United States and naturalized foreigners are *subjects* of the federal government; men in free governments are *subjects* as well as citizens; as citizens they enjoy rights and franchises, as *subjects* they are bound to obey the laws. 'My *subject* with my *subjects* under him.' *Tennyson.*

In *philos.* (a) the mind, soul, or personality of the thinker—the *Ego*; the thinking agent or principle. The *object* is its correlative, and uniformly expresses anything or everything external to the mind; everything or anything distinct from it—the *non-Ego*. The universe itself, when considered as a unique existence, is an object to the thinker, and the very *subject* itself (the mind) can become an object by being psychologically considered. These correlatives, *subject* and *object*, correspond to the first most important distinction in philosophy, viz. the original antithesis of self and not-self.

You think, and what does thinking imply? Manifestly a *subject* and an *object*—a thinking being and thought itself. *J. D. Morell.*

**Sublimation** (sub-lî-mâ'shon), *n.* 1. In chem. the act or process of sublimating; a process by which solid substances are, by the aid of heat, converted into vapour, which is again condensed into the solid state by the application of cold. Sublimation bears the same relation to a solid that distillation does to a liquid. Both processes purify the substances to which they are severally applied, by separating them from the fixed and grosser matters with which they are connected. Sublimation is usually conducted in one vessel, the product being deposited in the upper part of the vessel in a solid state, and often in the crystalline form, while the impurity remains in the lower part. If iodine, for example, be heated in a Florence flask a purple vapour rises, which almost immediately condenses in small brilliant, dark-coloured crystals in the upper part of the flask, the impurity remaining in the lower. The vapour of some substances which undergo the process of sublimation condenses in the form of a fine powder called *flowers*; such are the flowers of sulphur, flowers of benzoin, and others of the same kind. Other sublimates require to be in a solid and compact form, as camphor, hydrochlorate of ammonia, and all the sublimates of mercury.—2. The emotion produced by what is sublime; a feeling produced by the contemplation of great scenes and objects, or of exalted excellence. *Note.* The true nature of sublimity, whether of the emotion or that which causes it, is a subject of great interest and importance in mental philosophy, and it has always been a favourite subject of speculation. The invariable condition of sublimity in objects, either material or moral, is vastness, power, or intensity. The invariable condition of the emotion of sublimity—that which distinguishes this emotion from every other emotion—is a comprehension of this vastness of power, with a simultaneous feeling of our own comparative insignificance. The antithesis to the emotion of sublimity is the emotion of contempt. In every case of sublimity in material objects, whatever feelings may simultaneously concur, vastness will be found to be an invariable condition—vastness either of form or of power, as in the violent dashing of a cataract, in the roar of the ocean, in the violence of the storm, in the majestic quiet of Mount Blanc, preserving its calm amidst all the storms that play around it. In the moral world the invariable condition of sublimity is intensity. Mere intensity is sufficient to produce the sublime. Lear, who appeals to the heavens, 'for they are old like him,' is sublime from the very intensity of his sufferings and his passions. Lady Macbeth is sublime from the intensity of her will, which crushes every female feeling for the attainment of her object. Scævola, with his hand in the burning coals, exhibits an intensity of will which is sublime. In all the cases above mentioned we are moved by a vivid feeling of some greater power than our own, or some will more capable of suffering, more vast in its strength, than our feeble vacillating will.—3.† The sublimest or highest degree of anything; the height.

Substance is, with respect to the mind, a merely logical distinction from its attributes. We can never imagine it, but we are compelled to assume it. We cannot conceive substance shorn of its attributes, because those attributes are the sole staple of our conceptions; but we must assume that substance is some-

Thou art the most sufficient (I'll say for thee). *Bacon, & Fl.*

—Sufficient reason, according to the philosophical system of Leibnitz, a principle which admits nothing to exist without a sufficient reason of its existence, though that reason may not be known to us. Of contingent truths or facts, a sufficient reason must be found which may be traced up through a series of preceding contingencies till they ultimately terminate in a necessary substance, which is a sufficient reason of the whole series of changes, and with which the whole series is connected. In this way Leibnitz demonstrated the being of God. The same principle has been employed in mathematics to prove the equality of symmetrical solids or magnitudes which cannot be made to coincide or to fill the same space. Playfair, in his notes to his edition of Euclid's Elements, has expressed this principle as a general axiom, thus: 'Things of which the magnitude is determined by conditions that are exactly the same, are equal to one another; or two magnitudes A and B are equal, when there is no reason that A should exceed B, rather than that B should exceed A.' By the aid of the principle of sufficient reason we can compare geometrical quantities, whether they be of one, of two, or of three dimensions, nor is there any danger of being misled by this principle so long as it is confined to the objects of mathematical investigation; but in physical and metaphysical questions it cannot be applied with equal safety, because in such cases we have seldom a complete definition of the thing which we reason about, or one which includes all its properties.—**SYN.** Enough, adequate, competent, full, satisfactory, ample, abundant.

Sugar was little known in Europe till the time of the crusades. The Greek and Arabic words are from Per. *shakhara*, Prakrit *sakkara*, Skr. *ṣaṅkarā*, sugar. The Sanskrit form signified originally grains of sand, and was transferred to sugar which resembles such grains. The root is Skr. *ṣri*, to break into fragments.] 1. A well-known sweet granular substance, prepared chiefly from the expressed juice of the sugar-cane (*Saccharum officinarum*), but obtained also from a great variety of other plants, as maple, beet-root, birch, parsnip, &c. The process of manufacturing cane-sugar consists, generally, in pressing out the juice of the canes by passing them between the rollers of a rolling-mill. (See **SUGAR-MILL**.) The juice is received in a shallow trough placed beneath the rollers. This saccharine liquor is concentrated by boiling, which expels the water; lime is added to neutralize the acid that is usually present; the grosser impurities rise to the surface, and are separated in the form of scum. When duly concentrated the syrup is run off into shallow wooden coolers, where it concretes; it is then put into hogheads with holes in the bottom, through which the molasses drain off into cisterns below, leaving the sugar in the state known in commerce by the name of *raw* or *muscovado* sugar. This is further

purified by solution in water and filtration, first through cotton bags, then through layers of animal charcoal, boiling down under diminished pressure, and crystallization. Thus clarified it takes the names of *lump*, *loaf*, *refined*, &c., according to the different degrees of purification. The manufacture of sugar from beet-root is carried on to a very considerable extent in France, Germany, Austria, Belgium, Holland, Russia, &c. In the United States and in Canada great quantities of sugar are obtained from the sap of the sugar-maple (*Acer saccharinum*). Sugar is a proximate element of the vegetable kingdom, and is found in most ripe fruits and many farinaceous roots. By fermentation sugar is converted into alcohol, and hence forms the basis of those substances, as molasses, grapes, apples, malt, &c., which are used for making intoxicating liquors. The West Indies, Brazil, British Guiana, and Java are the principal sources whence our supplies of cane-sugar are derived; the sugar used on the Continent is chiefly obtained from the beet. Sugar was only vaguely known to the Greeks and Romans; it seems to have been introduced into Europe during the time of the crusades. The cane was grown about the middle of the twelfth century in Cyprus, whence, some time later, it was transplanted into Madeira, and about the beginning of the sixteenth century it was thence carried to the New World. Of all vegetable principles it is considered by many eminent physicians as the most wholesome and nutritious. Chemically, sugar is the representative of a class to which the name of *sucrose* or *saccharose* is given. Besides the sucroses the chemist is acquainted with another group of bodies represented by the sugar of most fruits, which he calls *glucoses*. The sucroses have the general formula  $C_{12}H_{22}O_{11}$ ; the glucoses, the general formula  $C_6H_{12}O_6$  ( $n$  being a whole number, whether unity or greater than unity is not as yet certainly known). When completely oxidized all sugars yield carbon dioxide and water; much heat is evolved during the oxidation. — 2. That which resembles sugar in any of its properties; as, *sugar of lead*, the acetate of lead, called *saccharum saturni* by the older chemists, from a supposed resemblance in its crystals to sugar, or from their having a slight sweetness in the mouth. Sugar of lead, though poisonous, is useful in medicine, having a strongly deversive quality; and it is much employed in calico-printing. — 3. *Fig.* sweet, honeyed, or soothing words; flattery employed to disguise something distasteful. — *Sugar of milk*, lactine (which see). — *Sugar of acorns*, quercite (which see).

Its average height is from 50 to 60 feet, with a diameter of from 12 to 18 inches. From its sap sugar is manufactured in considerable quantities in the United States and Canada. As the ascending sap is richest in sugar the trees are tapped in the early spring. Two holes about 20 inches from the ground are bored in the tree, and wooden spouts are driven into them, which convey the sap into troughs or pails placed on the ground. From the troughs it is conveyed to boilers, and manufactured into sugar on the spot. See *MAPLE*.

It consists usually of three heavy rollers, placed horizontally and parallel to each other, one above and between the other two. These are driven by a steam-engine, by water, or by animal power. The canes are made to pass between the rollers, by which means they are crushed, and the juice ex-

pressed from them. The annexed illustration represents a form of sugar-mill in common use. The motive power is applied directly to the upper roller, and is communicated with an equal velocity, by means of spur pinions, to the two lower rollers, which are brought nearly into contact with the upper, and the extremities of the axes of which are seen in the cut. The canes are spread upon the feeding-table regularly, and as nearly as possible at right angles to the axes of the rollers, and are first drawn downward between the upper and first lower roller, then upwards between the upper and second lower roller, being thus crushed so as to separate the liquor, which flows downwards into the hollow bed of the mill, and is then drawn off by a spout, while the empty canes are detached from the rollers, and guided to the floor of the mill by the delivering board. **Sugar-mite** (shu'gér-mít), *n.* A species of *Acarina* or mite, *Acarus sacchari*, found in raw or unrefined sugar. **Sulphamic** (sul'fâ-m'ik), *n.* Having sulphur and ammonium as the characteristic constituents.—*Sulphamic acid*, an acid, the ammonium salt of which is produced by the action of dry ammonia on dry sulphur trioxide. It may be regarded as sulphuric acid in which one O H group is replaced by NH<sub>2</sub>; thus, SO<sub>3</sub> (OH) is replaced by SO<sub>3</sub> (NH<sub>2</sub>). It is a monobasic acid, forming salts called sulphamates; of these ammonium sulphamate, SO<sub>3</sub> (NH<sub>4</sub>), is one of the best known.

**Sulphate** (sul'fât), *n.* [From *sulphur*.] A salt of sulphuric acid. Sulphuric acid is dibasic, forming two classes of sulphates, viz. *neutral sulphates*, in which the two hydrogen atoms of the acid are replaced by metal, and *acid sulphates*, in which one hydrogen atom only is so replaced. The general formula of the former class is M<sub>2</sub>SO<sub>4</sub>, and of the latter MHSO<sub>4</sub>. (M represents a monovalent metal.) Of the sulphates, some are found native; some are very soluble, some sparingly soluble, and some insoluble. All those that are soluble are recognized in solution by the test of nitrate or chloride of barium, which causes a white precipitate of sulphate of barium, insoluble in acids. All the insoluble sulphates, when fused with carbonate of soda, yield sulphate of soda, which may be recognized as above. Some neutral sulphates occur in the anhydrous state, and others occur combined with water. The most important sulphates are—sulphate of aluminium and potassium, or alum; sulphate of ammonium, employed for making carbonate of ammonia; sulphate of copper, or blue vitriol, much used as an escharotic in surgery, and also used in dyeing and for preparing certain green pigments; sulphate of iron, or green vitriol, used in making ink, and very extensively in dyeing and calico-printing; it is also much used in medicine; sulphate of calcium, or gypsum; sulphate of magnesium, used in calico-printing; sulphate of mercury, used in the preparation of corrosive sublimate and of calomel; bisulphate of potash, much used as a flux in mineral analysis; sulphate of sodium, or Glauber's salts; sulphate of quinine, much used in medicine; sulphate of zinc, or white vitriol, used in surgery, also in the preparation of drying oils for varnishes, and in the reserve or resist pastes of the calico-printer. Many double sulphates are known.

**Sulphite** (sul'fit), *n.* [From *sulphur*.] A salt of sulphurous acid. The sulphites are recognized by giving off the suffocating smell of sulphurous acid when acted on by a stronger acid. A very close analogy exists between them and the carbonates.

**Sulpho-acid** (sul'fô-as-id), *n.* An acid in which sulphur takes the place of oxygen; thus we have *sulpho-acetic acid*, *sulpho-cyanic acid*, &c., which may be regarded as the oxyacid in which the oxygen of the group O H is replaced by S; these acids are formulated as containing the group S H.

**Sulphocyanate, Sulphocyanide** (sul'fô-si'an-ât, sul'fô-si'an-id), *n.* A salt of sulphocyanic acid.

**Sulphoindigotic** (sul'fô-in-di-got'ik), *a.* Pertaining to, derived from, or containing sulphuric acid and indigo. Written also *Sulphindigotic*.—*Sulphindigotic* or *sulphindigotic acid* (C<sub>2</sub>H<sub>2</sub>NO<sub>2</sub>SO<sub>2</sub>), an acid formed by the action of sulphuric acid on indigo. When 1 part of pure indigo is added to 8 parts of sulphuric acid, the addition of water causes the deposition of a purple powder called *sulphopurpuric acid*, while a blue solution is obtained. The blue solution contains two acids, *sulphoindigotic acid* and *hypo-sulphoindigotic acid*.

**Sulphopurpuric Acid** (sul'fô-pêr-pû'rik as'id), *n.* See under **SULPHOINDIGOTIC**.

It has a very sour taste, and cannot be concentrated by evaporation without being decomposed into alcohol and sulphuric acid. It forms with most bases crystallizable salts, called *sulphovinates*, which are all soluble.

**Sulphur** (sul'fêr), *n.* [L. *sulfur*, *sulphur*.] 1. Sym. S. At. wt. 32. Brimstone, an elementary non-metallic combustible substance, which has been known from the earliest ages of the world. It occurs in great abundance in the mineral, sparingly in the vegetable, and still more sparingly in the animal kingdom. It occurs sometimes pure or merely mixed, and sometimes in chemical combination with oxygen and various metals, forming sulphates and sulphides. It is found in greatest abundance

and purity in the neighbourhood of volcanoes, modern or extinct, as in Sicily; and, as an article of commerce, is chiefly imported from the Mediterranean. That which is manufactured in this country is obtained by the roasting of iron pyrites. It is commonly met with in two forms; that of a compact, brittle solid, and a fine powder. It is nearly tasteless, of a greenish yellow colour, and when rubbed or melted emits a peculiar odour. Its specific gravity is 1.99; it is insoluble in water, and not very readily soluble in alcohol, but is taken up by spirits of turpentine, by many oils, and by carbon disulphide. It is a non-conductor of electricity. It is readily melted and volatilized. It fuses at 332° Fahr., and between 232° and 280° it possesses the greatest degree of fluidity, and when cast into cylindrical moulds forms the common roll-sulphur of commerce. It possesses the peculiar property of solidifying at a higher degree, or when raised to 320°. Between 430° and 480° it is very tenacious. From 490° to its boiling-point (792°) it again becomes liquid. At 792° it rises in vapour, and in close vessels condenses in the form of a fine yellow powder, called *flowers of sulphur*. When sulphur is heated to at least 430°, and then poured into water, it becomes a ductile mass, and may be employed for taking the impressions of seals and medals. Sulphur exists in two distinct crystalline forms, and also as an amorphous variety: these modifications are characterized by differences in specific gravity, in solubility in various liquids, and in many other points. Sulphur combines with oxygen, hydrogen, chlorine, &c., forming various important compounds. It unites also with the metals, forming sulphides. It is of great importance in the arts, being employed in the manufacture of gunpowder, lucifer-matches, vulcanite, and sulphurous and sulphuric acids. It is also employed in medicine, and for various other purposes.—*Crude sulphur*, the result of the distillation of native sulphur.—*Sulphur group*, the elementary substances sulphur, selenium, and tellurium; all having a strong attraction for oxygen.—*Roll or stick sulphur*, sulphur refined and cast into wooden moulds.—2† Considered as that of which lightning consists.

**Sulphuretted** (sul'fūr-et-ed), *a.* Applied to bodies having sulphur in combination.—*Sulphuretted hydrogen* (H<sub>2</sub>S), a compound formed when hydrogen and sulphur come in contact in the nascent state. It is a transparent colourless gas, recognized by its peculiar fetid odour, resembling that of putrid eggs. It is very deleterious to animal life, and is often formed where animal matters or excrements putrefy. It is the active constituent of sulphureous mineral waters. It is also known by the name of *Hydro-sulphuric Acid*, *Sulphydric Acid*, and *Hydrothionic Acid*. It is usually prepared by decomposing a metallic sulphide, especially sulphide of iron or of antimony, by means of hydrochloric or sulphuric acid.

**Sulphuric** (sul'fūr-ik), *a.* Pertaining to or obtained from sulphur.—*Sulphuric acid*, oil

of vitriol, a most important acid, discovered by Basil Valentine towards the close of the fifteenth century. It was formerly procured by the distillation of dried sulphate of iron, called *green vitriol*, whence the corrosive liquid which came over in the distillation, having an oily consistence, was called *oil of vitriol*. It is now prepared in this and most other countries by burning sulphur, or more frequently iron pyrites, in closed furnaces, and leading the fumes, mixed with oxides of nitrogen, into large leaden chambers, into which jets of steam are continuously sent. The oxides of nitrogen are produced by the action of sulphuric acid upon nitre contained in pots, which are placed between the sulphur ovens and the chambers. The sulphur dioxide takes away part of the oxygen from the oxides of nitrogen, which are again oxidized by the air in the chambers. The sulphur trioxide produced unites with the steam to form sulphuric acid. The acid produced in the chamber is condensed in leaden vessels until it reaches a certain gravity, when it is run into glass, or sometimes into platinum vessels, where the condensation is continued. Pure sulphuric acid is a dense, oily, colourless fluid, having, when strongly concentrated, a specific gravity of about 1.8. It is exceedingly acid and corrosive, decomposing all animal and vegetable substances by the aid of heat. It unites with alkaline substances, and separates most of the other acids from their combinations with the alkalis. It has a very great affinity for water, and unites with it in every proportion, producing great heat; it attracts moisture strongly from the atmosphere, becoming rapidly weaker if exposed. The sulphuric acid of commerce is never pure, but it may be purified by distillation. With bases sulphuric acid forms salts called sulphates, some of which are neutral and others acid. By concentrating sulphuric acid as far as is possible without decomposition, and cooling the liquid so obtained, crystals of the true acid, H<sub>2</sub>SO<sub>4</sub>, are formed. The ordinary acid is a hydrate of H<sub>2</sub>SO<sub>4</sub>, of varying composition. A form of sulphuric acid known as *Nordhausen acid* is prepared by heating green vitriol in closed vessels; it is a solution of sulphur trioxide in sulphuric acid (H<sub>2</sub>SO<sub>4</sub>, SO<sub>3</sub>), or it may be regarded as *pyrosulphuric acid* (H<sub>2</sub>S<sub>2</sub>O<sub>7</sub>). The best test of the presence of sulphuric acid, whether free or combined, is a soluble compound of barium. Thus, when a solution of chloride of barium is added to a liquid containing sulphuric acid it causes a white precipitate, viz. sulphate of barium, which is not only insoluble in water, but in the strongest acids. Of all the acids the sulphuric is the most extensively used in the arts, and is in fact the primary agent for obtaining almost all the others by disengaging them from their saline combinations. Its uses to the scientific chemist are innumerable. In medicine it is used in a diluted state as a refrigerant. See SULPHATE.—*Sulphuric ether*, ethylic, vinic, or ordinary ether—(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>O—a colourless transparent liquid, of a pleasant smell and a pungent taste, extremely exhilarating, and producing a degree of intoxication when its vapour is inhaled by the nostrils. It is produced by distilling a mixture of equal weights of sulphuric acid and alcohol, and by various other means. Its specific gravity is 0.720. It is extremely volatile and highly inflammable; and its vapour, mixed with oxygen or atmospheric air, forms a very dangerous explosive mixture. It dissolves in 10 parts of water, and is miscible with alcohol and the fatty and volatile oils in all proportions. It is employed in medicine as a stimulant and antispasmodic. The vapour of ether has been administered with success to patients when about to undergo surgical operations, but it is now to a great extent superseded by chloroform. True sulphuric ether, known also as *sulphate of ethyl*—(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>SO<sub>4</sub>—is an oily liquid, of burning taste and ethereal odour, resembling that of peppermint, of sp. gr. 1.120, and almost incapable of being distilled without decomposition, as at a temperature of about 280° it resolves itself into alcohol, sulphurous acid, and olefant gas.—*Sulphuric oxide*, or sulphur trioxide (SO<sub>3</sub>), is a white crystalline body produced by the oxidation of sulphurous oxide (which see). When this oxide is thrown into water it combines rapidly with the latter to form sulphuric acid.

**Sulphurous** (sul'fēr-us), *a.* Made or impregnated with sulphur; like sulphur; containing sulphur. 'There's the sulphurous pit.' *Shak.*—*Sulphurous oxide*, a gas formed by the combustion of sulphur in air or dry oxygen. It is transparent and colourless, of a disagreeable taste, a pungent and suffocating odour, is fatal to life, and very injurious to vegetation. At 45°, under the pressure of two atmospheres, it becomes liquid, and also at 0° under the pressure of one atmosphere. It extinguishes flame, but is not itself inflammable. It has considerable bleaching properties, so that the fumes of burning sulphur are often used to whiten straw, and silk and cotton goods. This gas is also called *Sulphur Dioxide*; when led into water it forms *sulphurous acid* (H<sub>2</sub>SO<sub>3</sub>). This acid readily takes up oxygen, passing into sulphuric acid; it is dibasic, forming salts called sulphites.

Or, a *surd* denotes the root of any quantity, when that quantity is not a complete power of the dimension required by the index of the root. Hence, the roots of such quantities cannot be expressed by rational numbers. angry words, or go about with unlawful weapons or attendance to the terror of the people. So if a private man has just cause to fear that another will burn his house, or do him a corporal injury, or will procure others to do so, he may demand *surety* of the peace against such person, and every justice of the peace is bound to grant it if satisfied that the person has good grounds for the application.

**Surface** (sér'fäs), *n.* [Fr. *surface*, from *sur*, upon, and *face*, or directly from *L. superficies*.] 1. The exterior part of anything that has length and breadth; one of the limits that terminates a solid; the superficies; outside; as, the *surface* of the earth; the *surface* of the sea; the *surface* of a diamond; the *surface* of the body; the *surface* of a cylinder; an even or an uneven *surface*. Popularly, *surface* is often used to signify, not merely the outside or exterior boundary of any substance, but also a certain thickness of the exterior material part. In this way we speak of the *surface* of the earth, the *surface* of the soil, of taking off the *surface* of anything, &c.—2. In geom. a superficies; that which has length and breadth only, and so distinguished from a *line*, which has length only, and from a *solid*, which has length, breadth, and thickness. The extremities of a surface are lines, and the intersections of one surface with another are also lines.—A *plane surface* is that in which any two points being taken the straight line between them lies wholly in that surface.—A surface which may be cut by a plane through any given point, so that the line of common section of the plane and surface may be a curve, is called a *curved surface*; as the surface of a sphere, cylinder, or cone. Surfaces are distinguished algebraically by the nature and order of their equations. Thus, we have surfaces of the first order, or plane surfaces, and surfaces of the second order, or curved surfaces. Surfaces are also distinguished by their mode of generation; thus the surface of a sphere is generated by the revolution of a semicircular arc about the diameter, which remains fixed. In physics, a surface is supposed to be composed of a number of material particles, placed together side by side, without any opening or interstice between them. Such a surface, therefore, cannot be said to be absolutely destitute of thickness, but may be regarded as a film of matter whose thickness is indefinitely small.—*Tabular surface*, a surface generated by a circle of a given radius, which moves with its centre on a given curve, and its plane at right angles to the tangent of that curve.—*Ruled surface*, a surface described by the motion of a straight line, which neither remains parallel to a given line nor always passes through a given point, as conoidal surfaces.—*Developable surface*, a surface that can be unwrapped in a plane without any doubling of parts over one another, or separation, as the surfaces of the cylinder and cone.—*Undevelopable surface*, a surface that cannot be developed in the plane.—3. Outward or external appearance; what appears on a slight or casual view or without examination; as, this arrangement, on the *surface*, was very advantageous.—4. In fort. that part of the side which is terminated by the flank prolonged, and the angle of the nearest bastion.

They are remarkable for their dense plumage, extreme length of wing, and velocity of flight, while their feet and legs are comparatively weak. Their food consists of insects, which they catch in the air, and thus they pass more of their time upon the wing than most other birds. Their bill is short and very broad at the base, so that the gape is remarkably wide. They are found almost all over the world. In temperate climates the swallows are migratory birds, marking the arrival of spring by their coming, and giving notice that summer is over by their departure to warmer regions. The common species in Britain are the chimney swallow (*Hirundo rustica*), the house-martin (*H. urbana*), and the sand-martin (*H. riparia*). The chimney swallow has the tail very deeply forked, the two outside feathers being far longer than any of the others. It is about 8½ inches in length. The upper parts and a broad

bar across the breast are bluish black, the forehead and throat chestnut, the under surface white. The nest is cup-shaped,

It builds a hemispherical nest of mud or clay under eaves, &c., with the entrance on one side. The sand-martin is smaller than either of the above, brownish on the upper parts, white below, with the tail moderately forked. It makes its nest in steep sandy banks, excavating by means of its bill a gallery 18 inches or more in depth for the purpose. The purple martin (*H. purpurea*) is a very common species in North America, and is a great favourite in the northern parts, where, like the British species, it serves as a herald of spring. Several other species belong to America.

family Cypselidae. They have an outward resemblance to the swallows, but differ much from them in various structural points. The common swift (*C. apus*) has the greatest powers of flight of any bird that visits Britain. Its colour is in general a sombre or sooty black, with a grayish-white patch under the

chin. The beak is black, shorter than that of the swallow, and without the lateral bristles. The wings are even longer than those of the swallow, and are sickle-shaped. The tarsi are short, and feathered to the toes, which are all directed forwards. The swifts pass most of their time in the air, where they pursue their insect prey. Their flight is swift and shooting, and their scream very different from the twittering of the swallow. They build their nests in holes in the walls of houses, in rocks, and sometimes in hollow trees. The swift reaches its summer quarters later, and leaves earlier than the swallows. Another species, the white-bellied or Alpine swift (*C. alpinus*), is known in this country, but it is only a rare straggler. The weight of the swift is most disproportionately small to its extent of wing, the former being scarcely an ounce, the latter 13 inches, the length of the body being near 8 inches. The swift is widely spread through Europe, Asia, and Africa. The American swift (*Chaturus pelagica*) is smaller, has the hind-toe directed backwards, and the tail-feathers stiff as in woodpeckers. It is commonly called the chimney swallow.—4. The common newt or eft, a species of lizard.

by itself; thus, in *tickle*, *reckon*, the final syllable is really *t* and *n*. In *logic*, a form of reasoning or argument, consisting of three propositions, of which the two first are called the *premises*, and the last the *conclusion*. In this argument the conclusion necessarily follows from the premises; so that if the two first propositions are true the conclusion must be true, and the argument amounts to demonstration. Thus, a plant has not the power of locomotion; an oak is a plant; therefore an oak has not the power of locomotion. These propositions are denominated the major, the minor, and the conclusion. The three propositions of a syllogism are made up of three ideas or terms, and these terms are called the *major*, the *minor*, and the *middle*. The subject of the conclusion is called the *minor* term; its predicate is the *major* term, and the middle term is that which shows the connection between the major and minor term in the conclusion; or it is that with which the major and minor terms are respectively compared. Syllogisms are divided by some into single, complex, conjunctive, &c., and by others into categorical, hypothetical, conditional, &c. What is called the *figure* of a syllogism is the proper disposition of the middle term with reference to the major and minor terms. The figures are by many logicians reckoned four, but the fourth is now usually considered as both unnatural and unnecessary, being only an awkward inversion of the first, to forms of which, indeed, all the other figures are held to be reducible. The *mood* of a syllogism is the designation of its three propositions, according to their quantity

Fâte, fâr, fat, fâll;

mê, met, hér;

pîne, pin;

nôte, not, môve;

tûbe, tub, bull;

oil, pound;

û, Sc. abune;

ÿ, Sc. sey.

and quality. The quantity and quality of propositions, in logic, are marked by arbitrary symbols, as A, E, I, O. Every assertion may be reduced to one of four forms—the universal affirmative, marked by A; the universal negative, marked by E; the particular affirmative, marked by I; and the particular negative, marked by O. From these, by combination, all syllogisms are derived. In order to remember the figures, certain mnemonic words have been long used by writers on logic; thus, under the first figure, we have Barbara, Celarent, Darii, Ferio; under the second, Cesare, Camestres, Festino, Baroko; under the third, Darapti, Disamis, Datisi, Felapton, Bocardo, Feriso; and under the fourth, Bramantip, Camenes, Dimaris, Fesapo, Fresison. (See these words.) Each of these words designates a particular mood. The rules of syllogism may be thus briefly expressed: (a) one at least of the premises must be affirmative, and one at least universal; (b) the middle term must enter universally in one of the premises; and (c) the conclusion must not speak of any term in a wider sense than it was spoken of in the premise in which it entered. A term universally spoken of is either the subject of a universal affirmative, or the predicate of any negative. Syllogisms are nothing else than reasoning reduced to form and method, and it is well to know, when an argument is presented in a puzzling or perplexing form, with perhaps a suppression of one of its essential propositions, how to supply the suppressed premises and put the argument into regular order; the truth or fallacy of the reasoning then become apparent at a glance.—2. Symphytism is of two kinds—(1) Particle-composition, or the coalescence of a particle with a principal word, as *nūt* for *ne uūt*; *nat* for *ne ut*, not to know; *aboard* for *on board*, &c. (2) Flexion, when a coalition of this kind gives any word a grammatical flexibility and a faculty of indicating relation, time, &c., as in Gr. *didōmi*, I give, where *mi* = I, *didō*, where *s* = *su*, thou, &c.; O.E. *thecc*, *thee ich* (so may I prosper); A.Sax. *thēon*, to prosper, and *ich*, I; O.E. *shalbe* for *shall be*.

burgh, for measuring the weight of the atmosphere by the compression of a column of gas. It consists of a glass tube about 18 inches long, having the lower end bent up like the tube of the wheel-barometer, each end being terminated by an elongated bulb. The upper end is hermetically sealed, but the lower end is left open. The upper part of the tube is filled with hydrogen gas, and the lower part with some fixed oil. The pressure of the atmosphere is exerted upon the surface of the oil, which is exposed to it in the turned-up open end of the tube. This pressure causes the oil to stand at a certain height in the tube, and to produce a certain compression in the column of hydrogen gas. As the atmospheric pressure becomes greater the oil will rise and the gas will be compressed into less space. The change in the bulk of the gas caused by a change in the atmospheric pressure is measured by a scale. The sympiesometer is sensitive, but inferior in accuracy to the common barometer. Written also *Simpiesometer*.

Tradition traces back the origin of the synagogue to patriarchal times, but it more probably dates from the Babylonian captivity, when the temple worship was necessarily in abeyance. Synagogues were erected not only in towns and cities but also in the country, especially near rivers, that they might have water for their purifications and ceremonies. At the extreme east end of the building was the holy ark, containing copies of the Pentateuch; in front of this was a raised platform for the reader or preacher. The men sat on one side of the synagogue, the women on the other, a partition 5 or 6 feet high dividing them. The chief seats for which the scribes and Pharisees strove were situated near the east end. The synagogue was governed by a council or college of elders, over whom was a president called the ruler of the synagogue. The service consisted of prayers, reading the Scriptures, and preaching and expounding of them. The chief ruler or one of the council might call upon any one present to address the people, or even a stranger might volunteer to speak. The synagogue service was at first confined to the Sabbath-days and festivals, but was latterly extended to Mondays and Thursdays. The modern synagogue differs little from the ancient, but the women are now provided with seats in a low latticed gallery.—*The Great Synagogue*, an assembly or council of 120 members said to have been founded and presided over by Ezra after the return from the captivity. (3) *Provincial*, in which the bishops and delegated clergy of one province only meet. This is called a convocation. (4) *Diocesan*, in which the bishop and delegated clergy of a particular diocese meet. In the Established Church of Scotland, a provincial synod is one of the church courts, composed of the several presbyteries within the bounds prescribed by the General Assembly, or of the ministers and elders who stand on the roll as constituent members of such presbyteries. The synod is a court of review immediately above the presbytery, but its judgments may be brought under the review of the General Assembly by reference, complaint, or appeal. Properly defined, *synonyms* are words of the same language and the same grammatical class, identical in meaning; or, more generally, *synonyms* are words of the same language which are the precise equivalents of each other. And if a definition of the word in the singular be insisted on, we may say that a noun or other part of speech, identical in meaning with another word of the same language and the same grammatical class, is the *synonym* of that word; or, less specifically, a *synonym* is a word identical in meaning with another word of the same language and the same grammatical class. But though this is the proper definition of true *synonyms*, it is by no means the ordinary use of the term, which is gener-

ally applied to words not identical, but similar, in meaning. Both in popular literary acceptation, and as employed in special dictionaries of such words, *synonyms* are words sufficiently alike in general signification to be liable to be confounded, but yet so different in special definition as to require to be distinguished.

Synthesis is also called the *Direct Method* or *Composition*, and is the reverse of *analysis* or *resolution*. See ANALYSIS.*

In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube, which being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure. By pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe acts on the principle of the sucking-pump, and is used by surgeons, &c., for washing wounds, for injecting fluids into animal bodies, and other purposes. A larger form is used for watering plants, trees, &c. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of, and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. Let us instance in a watch. *Butler.*

Hence, more specifically, (a) a number of heavenly bodies connected together and acting on each other according to certain laws; as, the *solar system*; the *system* of Jupiter and his satellites. 'Star and *system* rolling past.' *Tennyson.*

The blood of reptiles is cold—that is to say, slightly warmer than the external medium—owing mainly to the fact that the pulmonary and *systemic* circulations are always directly connected together, either within the heart or in its immediate neighbourhood, so that the body is supplied with a mixture of venous and arterial blood in place of arterial blood alone. *H. A. Nicholson.*

Jambolanum* is extensively cultivated in the East Indies on account of its edible fruit, sometimes called Java plum by Europeans, but jamoon by the natives. It is of a rich purplish colour, and of a subastringent sweetish taste, which

is more agreeable to the native than to the European palate. The bark is astringent, and dyes a brown colour; the wood is hard and durable, and much employed.

## T.

**T** is the twentieth letter of the English alphabet, a sharp mute consonant, closely allied to *d*, both being dentals. In forming it the tip of the tongue is pressed close to the root of the upper teeth, as may be perceived in uttering the syllables *at*, *ta*, *ot*, *to*. This is also the position of the tongue for the letter *d*, as in the syllables *ad*, *da*, *od*, *do*; but *d* is uttered with voice, whereas *t* is entirely non-vocal. In reality, *t* can be hardly said to have any sound at all, its use, like that of the other sharp mutes *k* and *p*, being merely to modify the manner of uttering the vocal sound which precedes or follows it. When *t* is followed by *h* in the same syllable, as in *think*, *that*, *with*, the combination forms two distinct sounds—*surd* or *breathed*, as in *think*, and *sonant* or *vocal*, as in *that*. These sounds were represented by two characters in Anglo-Saxon and Old English, and it is a pity the old letters were given up. The letters *ti* before a vowel, and unaccented, usually pass into the sound of *sh*, as in *nation*, *motion*, *partial*, which are pronounced *nashon*, *moshon*, *parshal*. In this case *t* loses entirely its proper sound or use, and being blended with the subsequent letter a new sound results from the combination, which is in fact a simple sound. If *s* or *z* precede *ti* (as in *mixture*, *question*), *t* retains its own sound, though in this case many speakers soften it to *ch* as in *church*, as they also do in such words as *mixture*, *posture*. In comparing words common to the Indo-European tongues we find that (as formulated by Grimm's law) *t* in English (as also in Dutch, Icelandic, Gothic, &c.) corresponds to *d* in Latin, Greek, and Sanskrit, and to *s* or *z* in German. Thus *E. tooth* = *L. dens*, *dentis*, *Gr. (o)dous*, *(o)dontos*, *Skr. dant*, *G. zahm*; *E. foot* = *L. pes* (*pedis*), *pedis*, *Gr. pous*, *podos*, *Skr. pada*, *G. fuss*; *E. two* = *L. duo*, *Gr. dyo*, *Skr. dva*, *G. zwei*; *E. to eat* = *L. edo*, *Gr. edo*, *Skr. ad*, *G. essen*, and so on. An *s* before *t*, however, hinders this change from taking place, and hence the *t* in *E. stand* appears also in *L. sto*, *Gr. hístēmi*, and *G. stehen*. The English *th*, on the other hand, answers to *t* in Latin, Greek, and Sanskrit, and to *d* in German; thus *E. thou* = *L. tu* and *Gr. tu*, *Skr. tvaṃ*, *G. du*; *E. three* = *L. tres*, *Gr. treis*, *Skr. tri*, *G. drei*. Hence it comes that *G. tag* = *E. day*; *gut* = *good*, *wasser* = *water*, and *zahm* = *tame*. In some Latin words *d* has been changed to *t*, hence *t* in *E. tear* (*n.*) = *t* in *L. lacrima* (for *lacrima*), *Fr. larme*, a tear. A final *t* has become attached to many English words to which it does not properly belong, this being particularly the case after *n* and *s*, as in *tyrant*, *pleasant*, *ancient*, *amidst*, *whilst*, *against*, &c. It has sometimes dropped out, as in *best*, *last*; so *th* has disappeared from *worship*. This letter is often doubled in the middle of words, seldom at the end, as in *butt*, *mitt*. *T* is often used to denote things of this form, as the T-palace in Mantua. See T-BANDAGE, T-BEARD, T-CLOTH, T-IRON, T-JOINT, T-SQUARE.—To a *T*, exactly, with the utmost exactness; as, to suit or fit to a *T*. The allusion is to a mechanic's T-square, by which accuracy in making angles, &c., is secured. [Familiar.]

We could manage this matter to a *T*. *Sterne.*

shorter. It was at first chiefly worn by the military, but afterwards became an ordinary article of dress among other classes in France and England in the middle ages. In this country the tabard is now only worn by heralds and pursuivants of arms, and is embroidered with the arms of the sovereign. This garment gave name to the ancient hostility from which Chaucer's Canterbury pilgrims started. Written also *Taberd*, *Tabert*.

It occurs either massive or crystallized, in rectangular four-sided tables. *Tabular spar* is the schaalstein of Werner, and the prismatic argite of Jameson. Called also *Wollastomite*. — *Tabular structure*, in *mineral*, a form of structure consisting of parallel plates separated by regular seams. It is the consequence of crystallization, and is not uncommonly confounded with stratification. — *Tabular differences*, in logarithmic tables of numbers, a column of numbers marked D, consisting of the differences of the logarithms taken in succession, each number being the difference between the successive logarithms in the same line with it. When the difference is not the same between all the logarithms in the same line the number which answers most nearly to it, one part taken with another, is inserted. In the common tables of logarithms the logarithms of all numbers from 1 to 10,000 can be found by inspection, but by the aid of the *tabular differences* the logarithms of numbers between 10,000 and 1,000,000 may be found. Also, by the aid of the same differences the number corresponding to any given logarithm can be found to five or six places. In logarithmic tables of sines, tangents, secants, cosines, cotangents, and cosecants there are three columns of *tabular differences* in each page. The first of these is placed between the sines and cosecants, the second between the tangents and cotangents, and the third between the secants and cosines. These numbers are the differences between the logarithms on the left hand, against which they are placed, and the next lower, increased in the proportion of 100 to 60. The use of these differences is to facilitate the finding of the logarithmic sine, tangent, secant, &c., for any given degrees, minutes, and seconds, or the degrees, minutes, and seconds corresponding to any given logarithmic sine, tangent, secant, &c.

On the velocity of the machine being lessened the mercury rises in the centre, causing a proportionate rise in the tube.—(b) An instrument for measuring the velocity of running water in rivers, &c., as by means of its action on a flat surface connected with a lever above the surface carrying a movable counterpoise, or by its action on the vanes of a wheel, whose revolutions are registered by a train of wheelwork.

**Talent** (tal'ent), *n.* [Fr. *talent*, L. *talentum*, from Gr. *talanton*, a thing weighed, a balance, from obs. *talao*, to bear, kindred with Skr. *tulā*, a balance, from *tul*, to lift up, to raise up; a root which appears also in L. *tollo*, *tuli*, to lift up; Goth. *thula*, and O.E. and Sc. *thole*, to bear, to suffer.] 1. The name of a weight and denomination of money among the ancient Greeks, and also applied by Greek writers and their translators to various standard weights and denominations of money of different nations; the weight and value differing in the various nations and at various times. The Attic talent as a weight contained 60 Attic minas, or 6000 Attic drachmas, equal to 56 lbs. 11 oz. English troy weight. As a denomination of silver money it was equal to £243. 15s. The great talent of the Romans is computed to be equal to £99. 6s. 8d. sterling, and the little talent to £75 sterling. A Hebrew weight and denomination of money, equivalent to 3000 shekels, also receives this name. As a weight, therefore, it was equal to about 93½ lbs. avoirdupois; as a denomination of silver it has been variously estimated at from £340 to £390, the higher value being that given by the latest authorities.—2. A gift, endowment, or faculty; some peculiar faculty, ability, or qualification natural or acquired. 'Wit, knowledge, or any other talent whatsoever.' *Addison.*

He is chiefly to be considered in his three different talents, as a critic, a satirist, and a writer of odes. *Dryden.*

The most necessary talent, therefore, in a man of conversation, which is what we ordinarily intend by a fine gentleman, is a good judgment. *Sterile.*

3. Mental endowments or capacities of a superior kind; general mental power: used in this sense either in singular or in plural: as, a man of talents; a man of great talent. This and the previous application of the word are probably borrowed from the Scriptural parable of the talents, Mat. xxv. 'The aristocracy of talent.' *Coleridge.* 'All the real talent and resolution in England.' *Ruskin.*

Like other men of talent, Fielding was unfortunate.

His talents, his accomplishments, his graceful manners made him generally popular. *Sir W. Scott.*

**Talented** (tal'ent-ed), *a.* Furnished with talents or great mental powers; possessing talents or endowments. [This word, as shown by the first quotation below, was introduced long ago, but seems not to have been in common use till quite recent times.

Coleridge and others have strongly objected to it (the former calling it 'a vile and barbarous vocable'), but without any good reason. The chief objection to it has been that it is a 'pseudo-participle,' a participle without a verb corresponding to it, but there are many words of exactly analogous formation in quite good usage; comp. *gifted, lettered, turreted, booted, bearded, slippered, landed, &c.* Mr. Fitzedward Hall instances *outtalented* and *untalented* from Richardson.]

What a miserable and restless thing ambition is, when one *talented* but as a common person, yet, by the favour of his prince, hath gotten that interest, that in a sort all the keys of England hang at his girdle. *Abb. Abbot (1562-1633).*

The way in which *talented* and many of its fellows were once frequently used shows that these words, to the consciousness of our ancestors, began with being strictly participles. At present they have the function of participial adjectives; and, what between their distinctive termination and their history, they are, therefore, to be considered, on scientific principles, as developments from ideal verbs. The analogy on which they are formed is, further, so well established, that, whatever Coleridge dogmatized in his haste, 'mere convenience' is quite ground enough to justify us in coining terms on the same model whenever they may be really required.

**Tale-piet, Tale-pyet** (tāl'pi-et), *n.* [From Sc. *piet*, a magpie, because of its chattering.] A tell-tale; a tale-bearer. [Scotch.]

1. A piece of wood on which notches or scores are cut, as the marks of number. In purchasing and selling it was customary for traders to have two sticks, or one stick cleft into two parts, and to mark with scores or notches on each the number or quantity of goods delivered, or what was due between debtor and creditor, the seller or creditor keeping one stick, and the purchaser or debtor the other. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In the exchequer tallies were formerly used, which answered the purpose of receipts as well as simple records of matters of account. Hence the origin of exchequer bills. In former times of financial difficulty, from the period of the Norman conquest the practice had been to issue exchequer tallies. An exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches, indicating the sum for which the tally was an acknowledgment. On two other sides opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction, were written by an officer called the writer of the tallies. This being done the rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counterstock*, was kept in the exchequer, and the other, the *stock*, only issued. When the part issued was returned to the exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This ancient system was abolished by 25 Geo. III. lxxvii.; and by 4 and 5 Will. IV. xv. all the old tallies were ordered to be destroyed. The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit. — 2. Anything made to suit or correspond to another.

That they were fram'd the tallies for each other. *Dryden.*

The term *tubafrial* is intended to apply to those materials which are derived from atmospheric waste, but have not been assorted in water. The *talus* found at the foot of every cliff consists of debris which may be washed down in part by rain, but the quantity of water is not sufficient to give it a stratified character. The coarser materials are found at the bottom of the slope, which has the fan-shaped characteristic of all sediment allowed to spread without restraint from a single point. *Prof. Young.*

by the varying length of the pod. The East Indian variety has long pods about 6 inches in length, with six to twelve seeds, whereas the West Indian variety has much shorter pods, containing one to four seeds. The tree has an elegant appearance, from its graceful pinnated foliage and its racemes of sweet-smelling flowers, the calyx of which is yellow, the petals yellow streaked with red, the filaments purple, and the anthers brown. Both varieties are cultivated for the sake of their shade, and their cooling grateful acid fruit. The pulp is imported into European countries. In the East Indies it is dried either in the sun or artificially with salt added, which latter kind is sent to Europe. The West Indian tamarinds are put into jars with layers of sugar between them, or with boiling syrup poured over them, and are called prepared tamarinds; but the East Indian tamarinds are most esteemed. The largest and most elegant species is *T. orientalis*, a native of Arabia, Persia, and the East Indies. **Tangence** (tan'jens), *n.* A touching; tangency.—The *point of tangence* is the point of contact of a tangent line.

**Tangency** (tan'jen-si), *n.* State of being tangent; a contact or touching.—*Problem of tangencies*, among the old geometers, a branch of the geometrical analysis, the general object of which was to describe a circle passing through given points, and touching straight lines or circles given in position, the number of data being always limited to three.

**Tangent** (tan'jent), *n.* [L. *tangens*, *tangens*, ppr. from *L. tangere*, to touch. Akin *tact*.] In *geom.* a straight line which touches or meets a circle or curve in one point, and which being produced does not cut it, as A, B, C, D, E, F in fig. 1.

Euclid has shown that the straight line drawn at right angles to the diameter of a circle, from the extremity of it, is a tangent to the circle. In *trigon.* the tangent of an arc or angle is a straight line touching the circle of which the arc is a part, at one extremity of the arc, and meeting the diameter passing through the other extremity. Thus, in fig. 2, let AII be a straight line drawn touching the circle ADE at A, one extremity of the arc AB, and meeting the diameter DE produced, which passes through the other extremity B in the point H; then AH is the tangent of the arc AB, or of the angle ACB, of which AB is the measure. The tangent of an arc or angle is also the tangent of its supplement. Thus, AII is the tangent of the supplement AI, or of the angle ACI; for it is easy to see that the definition above given applies equally to the arc AB and to the arc AI. The arc and its tangent have always a certain relation to each other; and when the one is given in parts of the radius, the other can always be computed by means of an infinite series. For trigonometrical purposes tangents for every arc from 0 degrees to 90 degrees, as well as sines, cosines, &c., have been calculated with reference to a radius of a certain length, and these or their logarithms formed into tables. In the higher geometry the word tangent is not limited to straight lines, but is also applied to curves in contact with other curves, and also to surfaces.—*Method of tangents*,

the name given to the calculus in its early period. When the equation of a curve is given, and it is required to determine the tangent at any point, this is called the *direct method of tangents*; and when the sub-tangent to a curve, at any point, is given, and it is required to determine the equation of the curve, this is termed the *inverse method of tangents*. The above terms are synonymous with the differential and integral calculus.—*Natural tangents*, tangents expressed by natural numbers.—*Artificial tangents*, tangents expressed by logarithms.—To go or fly off at a tangent, to break off suddenly from one line of action, train of thought, or the like, and go on to something else.

From Dodson and Fogg's his mind flew off at a tangent to the very centre of the history of the queer client. Dickens.

See under MIDDLE.—*Tangent scale*, a form of breech sight for cannon.

Its base has a curvature corresponding to the circumference of the breech of the gun, and its face is cut into steps corresponding to angles of elevation.—*Tangent screw*, a screw which acts in the direction of a tangent to an arc or circle. Such screws are used for minute adjustments of instruments of precision, as a considerable amount of rotation in the screw gives but a small amount of rotation to the circle or wheel. See WORM-WHEEL.

**Tangential** (tan'jen-shal), *a.* Pertaining to a tangent; in the direction of a tangent.—*Tangential force*, (a) the same as centrifugal force. Tannic acid, when pure, is nearly white, and not at all crystalline. It is very soluble in water and has a most astringent taste, with bitterness. It combines with animal gelatine, forming an insoluble curdy precipitate, which has been called *tannogelatin*. **Tanning** (tan'ing), *n.* 1. The practice, operation, and art of converting the raw hides and skins of animals into leather by effecting a chemical combination between the gelatine of which they principally consist and the astringent vegetable principle called tannic acid or tannin. The object of the tanning process is to produce such a chemical change in skins as may render them alterable by those agents which tend to decompose them in their natural state, as in connection with the subsequent operations of currying or dressing to bring them into a state of pliability and impermeability to water which may adapt them for many useful purposes to which leather is

applied. The larger and heavier skins subjected to the tanning process, as those of buffaloes, bulls, oxen, and cows, are technically called *hides*; while those of smaller animals, as calves, sheep, and goats, are called *skins*. After being cleared of the hair, wool, and fleshy parts, by the aid of lime, scraping, and other means, the skins are usually steeped in an infusion of ground oak bark, which supplies the astringent or tanning principle, and thus converts them into leather. Different tanners, however, vary much in the mode of conducting the process of tanning, and also the skins intended for different kinds of leather require to be treated differently. Various improvements have been made in the process of tanning, by which time and labour are much reduced; but it is found that the slow process followed by the old tanners produces leather far superior to that produced by quick processes.—2. Tapestry is made by a process intermediate between weaving and embroidery, being worked in a web with needles instead of a shuttle. Short lengths of thread of the special colours required for the design are worked in at the necessary places and fastened at the back of the texture. The term *tapestry* is also applied to a variety of woven fabrics having a multiplicity of colours in their design, which, however, have no other characteristic of true tapestry. See *GOBELIN*.—*Tapestry carpet*, the name given to a very elegant and cheap two-ply or ingrain carpet, the warp or weft being printed before weaving so as to produce the figure in the cloth.

**Tape-worm** (táp'wérn), *n.* [From their resemblance in shape to a tape.] The name common to certain internal parasites (Entozoa) constituting the order Cestodea or Tienia of the sub-kingdom Anneloidea, found in the mature state in the alimentary canal of warm-blooded vertebrates. Tape-worms are composed of a number of flattened joints or segments, the anterior of which, or head (which is the true animal), is furnished with a circlet of hooks and suckers, which enable it to maintain its hold on the mucous membrane of the intestines of its host. The other segments, called *proglottides*, are simply generative organs budded off by the head, the oldest being furthest removed from it, and each containing when mature male and female organs. The tape-worm has neither mouth nor digestive organs, nutrition being effected by absorption through the skin. The length of the animal varies from a few inches to several yards. The ova do not undergo development in the animal in which the adult exists. They require to be swallowed by some other warm-blooded vertebrate, the ripe proglottides being expelled from the bowel of the host with all their contained ova fertilized. The segments or proglottides decompose and liberate the ova, which are covered with a capsule. After being swallowed the capsule bursts and an embryo, called a *proscœlex*, is liberated. This embryo, by means of spines, perforates the tissues of some contiguous organ, or of a blood-vessel, in the latter case being carried by the blood to some solid part of the body, as the liver or brain, where it surrounds itself with a cyst, and develops a vesicle containing a fluid. It is now called a *scolex* or *hydatid*, and formerly was known as the *cystic worm*. The scolex is incapable of farther development till swallowed and received a second time into the alimentary canal of a warm-blooded vertebrate. Here it becomes the head of the true tape-worm, from which proglottides are developed posteriorly by gemination, and we have the adult animal with which the cycle begins. Eight true tape-worms occur in man, *Tænia solium*, the cystic form of which produces the measles of the pig, being the most common. Another, *T. medicamentata*, is developed from the scolex, which causes measles in the ox. The tape-worm of the dog, *T. serrata*, is the adult form of the scolex which produces staggers in sheep. *T. Echinococcus* of the dog produces hydatids in man, through the development in man of its immature young.

Another American species has been discovered in the Cordilleras, the back of which is covered with hair, and the bones of the nose more elongated and

approximating somewhat to the palæotherium. The *T. malayanus* or *indicus* is found in the forests of Malacca and Sumatra. It

is larger than the American species, and is a most conspicuous animal from the white back, rump, and belly contrasting so strongly with the deep sooty black of the rest of the body as, at a little distance, to give it the aspect of being muffled up in a white sheet. A thick, dark-coloured, viscid product obtained by the destructive distillation of organic substances and bituminous minerals, as wood, coal, peat, shale, &c. Wood-tar, such as the Archangel, Stockholm, and American tars of commerce, is generally prepared by a very rude process. A conical cavity is dug in the ground, with a cast-iron pan at the bottom, from which leads a funnel. Billets of wood (such as pine or fir) are thrown into this cavity, and being covered with turf are slowly burned without flame. The tar which exudes during combustion is conducted off through the funnel. In this country wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinegar (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, &c., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in Britain in the process of gas manufacture. It is a very valuable substance, in as much as the compounds obtained from it form the starting-points in so many chemical manufactures. See *COAL-TAR*. — 2. The appositeness of the appellation thus metamorphosed made it be received, and from that time French authors—and after them the rest of Europe—have called the *Tatars*, *Tartars*.] 1. It crystallizes in large rhombic prisms, transparent and colourless, and very soluble in water. It is inodorous and very sour to the taste. A high temperature decomposes it, giving rise to several new products. The solution of tartaric acid acts with facility upon those metals which decompose water, as iron and zinc. Tartaric acid is dibasic; its salts are called *tartrates*. Tartaric acid has a most remarkable disposition to form double salts, as the tartrate of potassium and sodium or Rochelle salts; the tartrate of potassium and antimony, or tartar emetic. There are five modifications of tartaric acid, characterized chiefly by the differences in the action exerted by them upon a ray of polarized light; such as dextro- or ordinary tartaric acid, levo-tartaric acid, para-tartaric or racemic acid, meso-tartaric acid, and meta-tartaric acid. Tartaric acid is largely employed as a discharge in calico-printing, and for making soda-powders. In medicine it is used in small doses as a refrigerant.

**Tasimeter** (ta-zim'e-tēr), *n.* [Gr. *tasis*, a stretching, tension, from *teinō*, to stretch, and *metron*, a measure.] An instrument invented by Mr. Edison of America for measuring extremely slight variations of pressure, and by means of these other variations, such as those of temperature, moisture, &c. It depends on the fact that a piece of carbon introduced into the course of an electric current offers a resistance to the passage of the current, which diminishes in a very marked degree in proportion to the amount of pressure exerted on the carbon. A small disc of carbon and another of vulcanite are held together between two platinum buttons, which may be brought into connection with a galvanic battery, and a strip of some substance like gelatine, which contracts and expands with great readiness, is so placed that by its variations in magnitude it varies the pressure on one of the platinum buttons, and hence on the carbon disc. The variations thus produced in the force of the electric current are measured by a very delicate galvanometer, which is also placed in the circuit. So delicate is the instrument that the heat of the hand held a few inches off causes a deflection of the needle; while by a slight alteration in form the weight and vital heat of the minutest insect may be determined.

A contribution levied by authority from people to defray the expenses of government or other public services; as, (a) a charge made by the national or state rulers on the incomes or property of individuals, or on the products consumed by them. It is said to be *indirect* when it is demanded from one person in the expectation and intention that he shall indemnify himself at the expense of another; as for example the taxes called customs, which are imposed on certain classes of imported goods, and those called excise duties, which are imposed on home manufactures or inland production. Its burrowing powers are remarkable, its hole being 6 or 7 feet deep, and running underground to a length of 30 feet. Though termed *Labradorica* it is not found in Labrador, but abounds in the sandy plains near the Missouri and Rocky Mountains. Let *u* represent any function whatever of the variable quantity *x*; then if *x* receive any increment, as *h*, let *u* become *u'*; then we shall have  $u' = u + \frac{du}{dx}h + \frac{d^2u}{dx^2}\frac{h^2}{2!} + \frac{d^3u}{dx^3}\frac{h^3}{3!} + \frac{d^4u}{dx^4}\frac{h^4}{4!} + \dots$ , where *d* represents the differential of the function *u*. The great value of this theorem was overlooked till it was made the basis of the differential and integral calculus by Lagrange in 1772.

It consists chiefly of silica with a little alumina, lime, and oxide of iron, and about 7 per cent of vegetable mould, of which 2.46 is nitrogen gas. The dried leaves of *Thea sinensis* or *chinensis* (the tea-plant), nat. order Ternstroemiaceae, extensively cultivated in China; also the plant itself. Teas are in commerce all brought under two distinct terms, *green teas* and *black teas*, and it was at one time believed that these were the products of two different species of *Thea*, black tea of *T. Bohea*, and green tea of *T. viridis*, now regarded by botanists as mere varieties of *T. sinensis*. Though the products of the same species, black and green teas are mainly the growth of different districts of China, but the two varieties may be produced in either district, the difference being attained by diverse methods of preparation. (See *THEA*.) The black teas include *bohea*, *congou*, *souchong*, and *peko*; the green teas *twankay*, *hysonskin*, *young hyson*, *hyson*, *imperial*, and *gunpowder*. An infusion of tea as a beverage has slight nutritive value, but it increases respiratory action, and seems to have a decidedly stimulative and restorative action on the nervous system, due to the essential oil and theine it contains, whilst the tannin which is also present is an astringent. The use of tea in this country dates from the middle of the seventeenth century.

The following advertisement appeared in the *Mercurius Politicus* of Sept. 30, 1663. 'That excellent and by all physicians approved China drink called by the Chineseans *Tcha*, and by other nations *tay*, alias *tee*, is sold at the Sultana Head Coffee House, London.' An entry of Pepys's *Diary* in 1660 runs: 'I did send for a cup of tea, a China drink, of which I had never drunk before.' Substitutes for tea have been found in the dried leaves of a number of plants, some of which contain the same stimulating quality, and to which the name tea has consequently been applied. See the end of this article. — 2. A decoction or infusion of tea leaves in boiling water, used as a beverage, which in this country is generally mixed with a little milk or cream and sweetened with sugar. — 3. Any infusion or decoction of vegetables for drinking; as, sage tea; chamomile tea, &c. — 4. A soup or extract of beef; as, beef tea. See *BEEF-TEA*. — 5. In many parts of Scotland, however, it remains all the year. Its whole length is about 14 inches. The bill has a horny tip, and is about as long as the head. The plumage of the back is grayish white, mottled with dark streaks; the wings exhibit brown and purplish hues; the tail is of a blackish brown tint. The normally secreted fluid, after performing its ordinary functions, passes through the lachrymal ducts and sac into the nasal channels. Moral and physical causes, however, as strong passion (grief, sorrow, joy), uncontrollable laughter, pain, especially in the eye itself, increase the secretion considerably, and when the lachrymal duct does not suffice to carry it off it runs over the eyelids. Fuller's Teasel (*Dipsacus Fullonum*). a, Scale of the receptacle. b, Corolla.

For this purpose the heads are fixed round the circumference of a large broad wheel or drum so as to form a kind of brush. The wheel is made to turn round while the cloth is held against the brush thus formed, and the fine hooked awn of the teasel readily insinuates itself into the web, and draws out with it some of the fine fibres of the wool. non-conducting ink and Bain's chemical paper. Cowper's *writing telegraph* imitates hand-writing by a pen at the receiving station being made to follow the movements of a pen at the sending station. Two wires are necessary, one of them to produce similarity of position as regards left and right displacement, the other as regards up and down displacement. Strips of paper are drawn past both pens by clockwork. In addition to the delicate *mirror or reflecting galvanometer* (see GALVANOMETER), which Sir W. Thomson invented in connection with the Atlantic telegraph, that distinguished electrician has invented a self-recording instrument, consisting of a light coil of wire, very delicately suspended in a magnetic field, the motions of which coil, when a current is passed through it, are the means by which messages are recorded. The coil is attached to a very light glass siphon in the shape of an exceedingly fine capillary tube, through which ink from a reservoir is drawn by electric attraction, the reservoir and the moving paper ribbon upon which the ink falls being oppositely electrified. The extremity of the siphon is not in contact with, but only very near the paper. When there is no current the ink traces a straight line; when the current is passing the marks or deviations constituting the letters are produced. The delicacy and rapidity of this instrument are even greater than those of the mirror galvanometer, and the siphon recorder accordingly is highly valued. Although the possibility of applying electricity to telegraphy was thought of in the latter half of the eighteenth century, the principal elements of success were wanting till the discoveries of the galvanic pile by Volta in 1800, and of electro-magnetism by Oersted in 1819, since which latter date the triumphs in electric telegraphy have been achieved. In Britain the first public introduction of telegraphy was made in 1845, and thirteen years later the submarine cable between the Old and New Worlds was successfully laid. In 1872 a really workable mode of sending simultaneously two messages in opposite directions on the same line was introduced, and it was also discovered that two messages could be sent in the same direction (duplex telegraphy). The two plans being combined formed quadruplex telegraphy, by which the message-carrying powers of the wires has been greatly multiplied. — 2. A telegraphic communication; a telegram. *Trollope*.

**Teleologist** (tel'ē-ō-lō-jist), *n.* One versed in teleology; one who investigates the final

cause or purpose of phenomena, or the end for which each has been produced.

It is a relief to us . . . to fall back on the more sober arguments of the *teleologists*, who, no doubt, cannot prove from the works of creation infinite wisdom, goodness, and power, but do prove an amount of wisdom, goodness, and power which satisfies the mind. Take for instance the . . . volume of Sir Charles Bell on 'the Hand,' and say whether it is possible to follow him through the niceties and beauty of adaptation which he demonstrates without acknowledging an inconceivable amount of ingenious contrivance and benevolent design. *Ed. Rev.*

While the explanation of the *teleologist* is untrue, it is often an obverse to the truth; for though, on the hypothesis of evolution, it is clear that things are not arranged thus or thus for the securing of special ends, it is also clear that arrangements which do secure these special ends tend continually to establish themselves—are established by the fulfilment of these ends. *H. Spencer*.

**Teleology** (tel'ē-ō-lō-jī), *n.* [Gr. *telos*, *teleos*, an end, and *logos*, discourse.] The science or doctrine of final causes: (a) the doctrine which asserts that all things which exist were produced by an intelligent being for the end which they fulfil; the science of the ends or design for which things exist or were created. The skeleton is well ossified; cranium provided with cranial bones, and a mandible is present; the vertebral column consists of more or less ossified vertebrae; the pectoral arch has a clavicle, and the two pairs of limbs, when present, are in the form of fins supported by rays; the gills are free, a bony gill-cover being always developed. The order comprises almost all the common fishes. It comprehends the sub-orders Malacopteri, Acanthini, Acanthopteri, Plectognathi, and Lophobranchii.

**Teleostion** (tel'ē-ō-stē-on), *n.* [Gr. *telos*, complete, *telos*, *teleos*, an end, and *stion*, an animal.] Any animal composed of a number of cells and arranged in tissues. *H. Spencer*.

**Telephone** (tel'ē-fōn), *n.* [Gr. *tēle*, at a distance, and *phōnē*, sound.] In a general sense any instrument or apparatus which transmits sound beyond its natural limits of audibility; thus the speaking-tube so much used in conveying the sound of the voice from one room to another in large buildings, or a stretched cord or wire attached to vibrating membranes or discs, constitutes virtually a telephone. But the name is generally restricted to an instrument transmitting sound by means of electricity and telegraph wires. About the year 1860 the idea that sound-producing vibrations could be transmitted through a wire by means of electricity began to be recognized by several men of science. Reis of Frankfurt invented an apparatus which could reproduce at a distant station the pitch of a musical sound by means of a discontinuous current along a telegraph wire. A great step in advance was made in 1876 when Prof. Graham Bell, a Scotchman resident in America, discovered an articulating telephone which depends upon the principle of the undulating current, and by means of which the very quality of a note, and therefore conversation itself, could be reproduced at a distant station. Several varieties of telephonic apparatus are now in everyday use for intercommunication between distant places. The Bell telephone in its common form is shown

in the accompanying cut. A strong ordinary bar magnet *m* has round one of its ends a coil of fine silk-covered wire in metallic

communication with the two terminals *s s*. One of the terminals communicates through a telegraph wire with one of the terminals of the coil of a precisely similar instrument at the other station, the remaining pair of terminals being connected through the earth, or through a return wire. Just in front of the extremity of the magnet there is a thin plate of iron *p*, and in front of this again there is the mouth-piece of a speaking-tube *o*. By this last the sounds to be transmitted are collected and concentrated, and falling on the metal plate cause it to vibrate. These vibrations in their turn excite undulating electric currents which correspond exactly with the vibrations; that is, with the original sounds. The electric currents being transmitted to the receiving telephone cause corresponding vibrations in the plate or disc in it, and these reproduce to the ear the original sounds.

**Telephone** (tel'ē-fōn), *v. t.* To transmit or reproduce, as sounds, speech, or the like, by means of the telephone.

**Telephonic** (tel'ē-fōn'ik), *a.* Of or relating to the telephone; communicated by the telephone; as, a telephonic communication.

**Telephorids** (tel'ē-for'i-dē), *n. pl.* [See TELEPHORUS.] A family of coleopterous insects of a long and narrow form, with perfect wings and elytra, found in spring upon flowers, especially those of the Umbelliferae. They are very voracious, feeding not only on other insects but on the weaker of their own kind. Among children they bear the names of *soldiers*, *sailors*, and *doctors*.

**Telephorus** (te-lef'ō-rus), *n.* [Gr. *telos*, an end, and *phorēō*, to bear.] A genus of coleopterous insects, the type of the family Telephoridae.

Subsequent investigations have led to the strong suspicion that the sandstone is triassic.

**Telescope** (tel'ē-skōp), *n.* [Gr. *tēleskopos*, far-seeing, seeing afar, from *tēle*, at a distance, and *skopēō*, to view.] 1. An optical instrument essentially consisting of a set of lenses fixed in a tube or a number of sliding tubes, by which distant objects are brought within the range of distinct, or more distinct vision. The law of action by which the telescope assists human vision is twofold, and that under all the varieties of its construction. A distant object viewed by the unaided eye is placed in the circumference of a large circle, having the eye for its centre, and consequently the angle under which it is seen is measured by the minute portion of the circumference which it occupies. Now, when the distance is great, it is found that this angle is too small to convey to the retina any sensible impression—all the light proceeding from the object is too weak to affect the optic nerve. This limit to distinct vision results from the small aperture or pupil of the eye. The telescope substitutes its large object lens or reflector for the human eye, and consequently receives a quantity of light proportioned to its

area or surface; hence a distant point, inappreciable by the eye alone, is rendered visible by the aid of the telescope. The rays of light, after transmission or reflection, converge to a point as they at first proceeded from a point, and thus an image of the object is formed which, when viewed by the eye-piece or lens, is more or less magnified. The telescope therefore assists the eye in these two ways: it gathers up additional light, and it magnifies the object; that is to say, its image. The refracting telescope is constructed of lenses alone, which, by successive refractions, produce the desired effect. This instrument was formerly very cumbersome and inconvenient, inasmuch as its length had to be increased considerably with every accession of power; and though the substitution of achromatic for ordinary lenses has rendered it more portable, its construction even at the present day does not enable it to compete with the reflecting telescope as an astronomical investigator. The reflecting telescope is composed of specula or concave reflectors, aided by a refracting eye-piece. To this instrument we owe the most wondrous discoveries in astronomical science. The names of Newton, Gregory, Herschel, and Lord Rosse are connected with its history. The following diagrams exhibit the principles of construction and action in both

Fig. 1.

sorts of telescopes. In fig. 1, which illustrates the refracting telescope in its simplest form, A and B are two lenses of different focal lengths. Rays of light from a distant object falling upon the object-glass A are converged to a focus at C. The eye-glass B, placed at its focal distance from the point of convergence, gathers up the diverging rays and carries them parallel to the eye, magnifying the image formed at C. The magnifying power of the instrument is as A.C. : C.B. or as the focal length of one lens to that of the other. In this construction the object is inverted by the intersection of the rays, and hence it is unsuitable for terrestrial purposes. To render the image erect a more complicated eye-piece, consisting of two additional lenses, is necessary. Fig. 2 shows

Fig. 2.

the structure of the reflecting telescope as constructed by Dr. Gregory. AB is a large speculum perforated in the centre; upon this fall the rays b, a and d, c, which are reflected to convergence at e. A smaller speculum, c, takes up the diverging rays and reflects them, slightly converging, through the aperture o, where they are received by a lens, and, after transmission, they intersect at x, and proceed to the eye-glass, whence they emerge parallel. The magnifying power of this instrument is great for its length, being as  $\frac{o e \times x C}{e C \times x o}$ . In the telescope invented by Sir Wm. Herschel there is no second speculum, and no perforation in the centre of the larger one placed at the bottom of the tube. The latter is fixed in an inclined position so that the image formed by reflection falls near the lower side of the tube at its open end or mouth, where it is viewed directly by an eye-piece without greatly interfering with the light. This arrangement, in the case of large reflectors, is imposed by their great weight and difficult management. Were it otherwise the ordinary construction would be preferred, the inclination of the speculum being a disadvantage. Chromatic aberration, which arises from the different refrangibilities of the various coloured rays, and leads to the formation, by a lens, of a separate image of a bright object for each coloured ray, is remedied by achromatizing the

lens, that is, by constructing it of two or more lenses of different kinds of glass, so that the colours, separated by one, shall be reunited by the others. See ACHROMATIC.—2. Same as *Telescopium*.—*Prism telescope*. See TELESCOPE.

Tellurium is very brittle, and has a sp. gr. of 5.7–6.1. It is very fusible, and volatile at a red heat. It sometimes gives forth an odour of sulphuretted hydrogen during combustion, which has been ascribed to the presence of minute portions of selenium.

State with respect to the relative proportion of different qualities or constituent parts; constitution; due mixture of opposite or different qualities; a condition resulting from the proper blending of various qualities.

Safest, therefore, to me it seems that none of the Council be moved unless by death or by just conviction of some crime. However, I forejudge not any probable expedient, any *temperament* that can be found in things of this nature, so disputable on either side. *Milton.*

Many *temperaments* and explanations there would have been if ever I had a notion that it (a pamphlet) should meet the public eye. *Burke.*

Auricular confession . . . an imperative duty in the Church of Rome, and preserved as such in the six articles, and in the codes published by Henry VIII., was left to each man's discretion in the new order, a judicious *temperament* which the reformers would have done well to adopt in some other points. *Hallam.*

3. That individual peculiarity of physical organization by which the manner of acting, feeling, and thinking of each person is permanently affected. The ancients distinguished four temperaments, which derived their names from the fancied excess of one or other of the principal humours or fluids of the body; as, the *choleric* or bilious, from *Gr. cholé*, bile; the *phlegmatic*, from *phlegma*; the *melancholic*, from *melaina*, black, and *cholé*, bile; and the *sanguine*, from *L. sanguis*, blood. Many modern authorities have adopted a classification indicative of the fulness of habit and relative activity of the nutritive functions, and cerebro-spinal activity, employing the terms *sanguineous*, *nervous*, *nervo-sanguineous*, *sanguineo-nervous*, *lymphatic*, and *phlegmatic*. Dr. Cullen and others admit of only two temperaments, the sanguine and the melancholic, considering the phlegmatic a degree of the sanguine, and the choleric of the melancholic; and many of the so-called temperaments, as the bilious, melancholic, and lymphatic have been looked upon merely as departures from health, the result of imperfect development, incorrect habits, bad nutrition, and inactive functions of the body, which may be modified or removed by corrected habits, regimen, or medical treatment.—4. † Condition as to heat or cold; temperature. 'In proportion to the fertility of the soil and the *temperament* of the climate.' *Cook.*

Bodies are denominated hot or cold in proportion to the present *temperament* of our body to which they are applied. *Locke.*

5. In *music*, a certain adjustment or regulation of the tones or intervals of the scale of fixed-toned instruments, as the organ, piano, and the like, with the view of removing an apparent imperfection, and fitting the scale for use in all keys without offence to the ear. The intervals between the notes of the natural scale are by no means equal. Thus, sup-

posing the perfect octave to be divided into fifty-three equal parts, or *commas* as they are technically called, and taking C as the key-note or tonic, the intervals between the notes would be made up as follows: C to D, 9 commas; D to E, 8; E to F, 5; F to G, 9; G to A, 8; A to B, 9; B to C, 5. We have here three species of intervals, of which those represented by 9 are called major tones; those by 8, minor tones, and those by 5, major semitones. A fixed-toned instrument tuned on this principle would fully satisfy the ear with the correctness of its tones and the richness of its concords while the key of C was adhered to. But if we start, say, from D as a key-note, the proportions of the scale, or the sequence of the major and minor tones and of the semitones, are destroyed. D to E would form a tolerable, though not absolutely correct second, but the third and seventh of the scale would be entirely wrong. Were the major and minor tones equal, and each semitone exactly half a tone, the insertion of a note between each full tone, exactly dividing the intervals between them, would give an ideally symmetrical scale, and it would be immaterial where the scale began, as each of the twelve notes would be available as a key-note. Now, though such an equality is contrary to the principles of harmonics, an adjustment or arrangement of the sounds of fixed-toned instruments founded on it gives practically no offence unless to the critical ear. In what is termed *equal* or *even temperament*, which is now, theoretically at least, adopted for all pianos, organs, harmoniums, &c., the twelve semitones are all adjusted so as to stand at intervals of the same length, and thus no advantage is given to one key over another. In the *unequal* or *vulgar temperament*, formerly adopted for organs, some popular keys, as B♭, F, C, G, and D, were favoured at the expense of the rest, that is, the true intervals of the normal or natural scale were pretty closely adhered to; but the harsh fifths and thirds (the 'Wolf tones' of musicians) occurring in the keys written in several flats or sharps caused this system to be abandoned. The different characters of the various keys recognized on most fixed-toned instruments could have no existence were equal temperament absolutely adhered to, and are due to the fact that some discrimination is still practically used in favour of certain popular keys, though not to such an extent as to injure very sensibly the effect of keys less favoured. The only instruments of orchestral importance capable of producing just intonation, or of being played in perfect tune, are those of the violin family, which in this respect approach the perfection of the human voice; and were not a habit of incorrect intonation too often acquired by performing to the accompaniment of tempered instruments, the skilful singer or violinist could produce his notes in true key relationship through the most intricate modulations or changes of key.

**Temperamental** (tem'pér-a-men'tal), *a.* Constitutional. [Rare.]

Intellectual representations are received with as unequal a fate upon a bare *temperamental* relish or disgust. *Glanville.*

Into thy mother's lap. *Milton.*

*Temperance* permits us to take meat and drink not only as physic for hunger and thirst, but also as an innocent cordial and fortifier against the evils of life, or even sometimes reason not refusing that liberty, merely as a matter of pleasure. The basis on which these associations have generally been formed has been that of an engagement on the part of each member to abstain from the habitual and improper use or indulgence in intoxicating liquors. As the most strictly limited use of intoxicants as beverages is condemned by many social reformers as physically and mentally injurious, this name has been applied to, or assumed by, associations which are more correctly designated total abstinence or teetotal societies.

Most goodly *temperance* you may deary. *Spenser.*

3. † Mixture, or that which is made by mixture; a compound. 'Made a *temperance* of brass and iron together.' *Holland.* 'A proper *temperance* of fear and love.' *Abp. Secker.*—4. † Temper of metals. 'The due *temperance* of stiff steel.' *Holland.*—

5. † Moderate degree of atmospheric heat; temperateness of climate. 'If instead of this variation of heat we suppose an equality or constant *temperance* of it before the deluge.' *Woodward.*—6. The state of a body with regard to heat; the degree or intensity of the heat effects of a body; the thermal state of a body considered with reference to its power of communicating heat to other bodies. When two bodies are in contact, and the flow of heat from the one body to the other is equal—that is, when by contact neither is heated or cooled by the other—they are said to be of the same *temperance*. Two bodies may have the same *temperance* and yet contain very different quantities of heat per unit of mass, so that the *temperance* of a body is not a measure of its heat. If heat be considered as a motion of the molecules of a body, *temperance* may be considered a measure of the velocities of the molecules. When we speak of a body having a 'high' or a 'low *temperance*' it is implied that the condition of heat in the body may be compared with some standard. The means of such comparison is the thermometer, and the most convenient standard condition is apparently that of a body at the melting-point of ice, which is marked on the Centigrade thermometer scale and on Réaumur's as zero. See THERMOMETER.—*Animal temperance*, the degree or intensity of heat of animal bodies. This varies considerably with the classes of animals; thus the average *temperance* of mammals is stated at 101° Fahrenheit; that of birds, at 107°. Below mammals and birds animals are termed 'cold-blooded,' this term meaning in its strictly physiological sense that the *temperance* is usually that of the medium in which they live, and that it varies with that of the surrounding medium. The average normal *temperance* of the human adult is about 98° F., but in some cases of disease, as fevers, it may rise to 106°, 107°, or even as high as 112°, while in other cases, as morbus cereleus and Asiatic cholera, it may fall as low as 77° F.—*Mean temperance*, a mean of all the atmospheric *temperances* observed at a given place or under certain circumstances at regular intervals during a certain space of time. The mean annual *temperance* of any place is obtained by taking a mean of all the *temperances* indicated by the thermometer each day throughout the year. The *temperance* of a place depends not only on its latitude, but also on its elevation above the level of the sea, and various other local causes, such as the nature of the soil, the prevailing winds, the quantity of moisture, the electric state of the atmosphere, and the physical character of the adjacent countries and seas. But no cause has such an effect in lowering the *temperance* of a place as elevation above the level of the sea; and hence near the equator there are mountains which, owing to their great elevation, are covered with snow all the year round. (See SNOW-LINE.) The *temperance* of the sea is more uniform and moderate than that of the land.

**Tempered** (tem'pərd), *a.* Having a certain disposition or temper; disposed; often used in composition; as, a well-*tempered*, good-*tempered*, or bad-*tempered* man.

**Tempering** (tem'pə-rīng), *n.* The process of giving the requisite degree of hardness or softness to a substance, as to iron or steel; especially, the process of giving to steel the different degrees of hardness required for the various purposes to which it is applied. The process essentially consists in plunging the steel when red-hot into cold water or other liquid to give an excess of hardness, and then gradually reheating it until the hardness is reduced or brought down to the required degree. The excellence of all cutting steel instruments depends on the degree of temper given to them. Different degrees of temper are indicated by different colours which the steel

assumes. Thus steel heated to 450°, and suddenly cooled, assumes a pale straw colour, and is employed for making razors and surgical instruments. See STEEL.

**Tempest** (tem'pest), *n.* [O. Fr. *tempeste*, Mod. **Templar** (tem'plār), *n.* 1. One of a religious military order first established at Jerusalem in favour of pilgrims travelling to the Holy Land. The order originated with some persons who, in 1118, devoted themselves to the service of God, promising to live in perpetual chastity, obedience, and poverty, after the manner of canons. Baldwin II., king of Jerusalem, bestowed on them their first place of residence in the city, close to the Temple, and an additional building was acquired from the abbot and canons of the church and convent of the Temple, whence the order received the name of the 'poor soldiers of the Temple,' afterwards converted into *Templars*, or *Knights Templars*. The knights wore a white cloak adorned with a red cross of eight points (the

Maltese cross) on the left shoulder. In 1228 this order was confirmed in the Council of Troyes, and subjected to a rule of discipline. It flourished, became immensely rich and powerful, and its members became so arrogant and luxurious that the order was suppressed by the Council of Vienne in 1312.—2. A student of the law, or a lawyer, so called from having chambers in the Temple in London. See TEMPLE, 5.

**Temple** (tem'pl), *n.* [Fr. *temple*, from L. *templum*, a temple; originally a place marked or cut off, properly a piece marked off by lines which the augurs traced for their observations, then a piece of land marked off from common uses, and dedicated to a god; from root *tem* in Gr. *temnō*, to cut, whence Gr. *temenos*, a temple.) 1. An edifice dedicated to the service of some deity or deities, and connected with some pagan system of worship; originally, an edifice erected for some Roman deity; but the term is generally applied to such edifices among the Greeks, Egyptians, and other ancient nations as well as to structures serving the same purpose among modern heathen peoples. The most celebrated and imposing of the ancient temples were those of the Greeks, such as that of Artemis or Diana at Ephesus, that of Zeus Olympius in Athens, and that of Apollo at Delphi. The form most generally given to the ancient temples was that of a rectangle, but sometimes the construction was circular. Vitruvius divides temples into eight kinds, according to the arrangement of their columns, viz. temples in *antis* (see ANTA), *prostyle*, *amphiprostyle*, *peripteral*, *dipteral*, *pseudodipteral*, *hypæthral*, and *monopteral*. (See these terms.) In regard to intercolumniation, they are further distinguished into *pycnostyle*, *syntyle*, *eustyle*, *diastyle*, and *aræostyle*, and to the number of columns in the portico, *tetrastyle*, *hexastyle*, *octastyle*, and *decastyle*. (See these terms.) Of circular temples there are two species, the *monopteral*, without a cell, and the *peripteral*, with a cell.—2. Any one of the three successive edifices built on Mount Moriah at Jerusalem, and dedicated to the public worship of Jehovah. The second was constructed by the Jews on their return from the captivity about 536 B.C., and was pillaged or partially destroyed several times, as by Antiochus Epiphanes (170 B.C.), Pompey (63 B.C.), Herod (37 B.C.). The third, the largest and most magnificent of the three, was begun by Herod the Great in 20 B.C., and was completely destroyed at the capture of Jerusalem by the Romans, 70 A.D.—3. Those buildings have long been occupied by barristers, and are the joint property of the two societies, called the Societies of the Inner and of the Middle Tem-

Holding fast, or inclined to hold fast; inclined to retain what is in possession; with of before the thing held; as, men *tenacious* of their just rights; men are usually *tenacious* of their opinions, as well as of their property. That property of material bodies by which their parts resist an effort to force or pull them asunder, or the measure of the resistance of bodies to tearing or crushing; opposed to *brittleness* or *fragility*. Tenacity results from the attraction of cohesion which exists between the particles of bodies, and the stronger this attraction is in any body the greater is the tenacity of the body. Tenacity is consequently different in different materials, and in the same material it varies with the state of the body in regard to temperature and other circumstances. The resistance offered to tearing is called *absolute tenacity*, that offered to crushing, *retroactive tenacity*. **Tenure** (ten'ür), *n.* [Fr. *tenure*, L. *L. tenura*, from *L. teneo*, to hold.] 1. The act, manner, or right of holding property, especially real estate. Land may be held according to two main principles, the tenure being either *feudal* or *allodial*. According to the latter tenure, the whole right and title of the land rests with the owner; according to the former, the person possessing the subject holds it from a superior, and this is the principle universal in England. According to the theory in England all land is held of the crown, either mediately or immediately. The ownership of land is therefore never unlimited as to extent, for he who is the owner of land in fee, which is the largest estate that a man can have in land, is not absolute owner; he owes services in respect of his fee (or fief), and the seignory of the lord always subsists. All land in the hands of any layman is held of some lord, to whom the holder or tenant owes some service; but in the case of church lands, although they are held by tenure, no temporal services are due, but the lord of whom these lands are held must be considered the owner, although the beneficial ownership can never revert to the lord. All the species of ancient tenures may be reduced to four, three of which subsist to this day:—(1) *Tenure by knight service*, which was the most honourable. This is now abolished. (2) *Tenure in free socage*, or by a certain and determinate service, which is either free and honourable, or villein and base. (3) *Tenure by copy of court roll*, or *copyhold tenure*. (4) *Tenure in ancient demain*. There was also *tenure in frankalmoigne*, or free alms. The tenure in free and common socage has absorbed most of the others. It is a long, worm-shaped, grayish-white animal, about 1 foot in length and  $\frac{1}{2}$  inch in thickness. Its great length is owing to the elongation of the siphons or breathing tubes conveying water to the gills. The two valves or halves of the

shell are small and globular in shape. The viscera and body are mainly contained within the valves. In excavating into the wood

*Terebra navalis*, and piece of wood perforated by *Terebra*.

(the shell is the boring instrument) each individual is careful to avoid the tube formed by its neighbour, and often a very thin leaf alone of wood is left between the cavities, which are lined with a calcareous incrustation. Many plans are tried to protect ships, piers, &c., from this destructive animal, such as copper sheathing, treating with creosote or corrosive sublimate, or driving a number of short broad-headed nails into the timber, the rust from which spreads and prevents the animal from settling. It is said to have been originally imported from tropical climates; but it has now become an inhabitant of most of the harbours of this country. — *T. gigantea*, a species 5 feet long and upwards, is found in the East Indies in shallow water, where it bores into the hardened mud of the seabed.

It would be a mistake to represent these difficult noble inquiries as having nothing in view beyond ascertaining the conventional meaning of a name. 2. Collectively, the terms used in any art, science, and the like; nomenclature; as, the *terminology* of botany. It is sometimes restricted to the terms employed to describe the characters of things as distinguished

from nomenclature. See under **NOMENCLATURE**.

A scientific observer must be not only familiar with the *terminology* of his science, and be able to apply its technical terms readily to the proper objects, but he ought likewise to have acquired that delicacy, rapidity, and correctness of discernment which the habit of observation, combined with knowledge, can alone confer. **Termites, Termitidæ** (tèr'mi-tèz, tèr-mit'î-dè), *n. pl.* [*L. termes, termitis*, a wood-worm.] A family of neuropterous insects, known by the name of white ants, corresponding with the Linnean genus *Termes*. These insects have little affinity with the true ants, which are hymenopterous, although they resemble them in their mode of life. They are chiefly confined to the tropics, and are found very plentifully in Western Africa. They unite in societies, building their dwellings on the ground, in the form of pyramids or cones, 10 or 12 feet high. These dwellings, which are so firmly cemented as to be capable of bearing the weight of three or four men, are divided off into several apartments as magazines, chambers, galleries, &c. Every colony of termites consists of a king and queen, both of which are much larger than the other members of the colony, and of workers and soldiers, which are without wings. The king and queen are the parents of the colony, and are constantly kept together, attended by a detachment of workers, in a large chamber in the heart of the hive, surrounded by

b. Pupa or soldier, }

stronger walls than the other cells. The queen is always gravid, the abdomen being enormously distended with eggs, which, as they are dropped, relays of workers receive and convey in their mouths to the minor

cells throughout the hive. At the beginning of the rainy season a number of winged insects, both male and female, is produced,

the wings having, in order to the future development of the insect, transverse seams across the roots, dividing the nervures. These insects when mature leave the hive and fly abroad, afterwards shedding the wings by means of the seams referred to, and becoming the kings and queens of future colonies. The soldiers and workers, both neuter, or of no fully developed sex, and differing merely in the armature of the head, are distinct animals from the moment they leave the egg, the young differing from the adult of the same class only in size. The duties of the workers are to build the habitations, make covered roads, nurse the young, attend on the king and queen, and secure the exit of the mature winged insects, while to the soldiers, whose mandibles are powerfully developed for that purpose, is committed the defence of the community, which duty they perform with both system and desperate courage. There are many species of termites, all of which are fearfully destructive to wood. They have been known to destroy the whole woodwork of a house in a single season.
